A Deep Dive into Personalized Vaccines
Wednesday, April 3, 2024, 12–2 p.m. EDT

About the Webinar
In this webinar, faculty will discuss the processes of neoantigen identification and selection for cancer vaccine development and the role of dark antigens, cancer-specific neoantigens derived from non-coding parts of the genome.

The webinar will also address vaccine-induced changes in the tumor microenvironment and how these changes can inform future vaccine development and/or delivery.

An interactive Q&A session will follow the topic overview, providing participants with the opportunity to ask in-depth questions of the faculty as well as offering a forum for networking and initiation of collaborations with others working in a similar field.

Special Offer:
At the time of registration, if you buy 4 webinars, you get the remaining 3 for free!

Moderators:
- Lelia Delamarre, PhD, Genentech
- Robert Seder, MD, National Institutes of Health (NIH)

Faculty:
- Vinod Balachandran, MD, Memorial Sloan Kettering Cancer Center
- Megan L. Burger, PhD, Oregon Health & Science University
- Morena D’Alise, PhD, Nouscom
