

PREPARED FOR APIC SIERRA CHAPTER CONFERENCE

Optimizing Postoperative Outcomes: The Role of Nutrition

7 | November 2024

Agenda

- Discuss the healthcare landscape specific to surgical care and malnutrition.
- Define the relevance of nutrition status in relation to risk of infectious and overall complications.
- Analyze key evidence and foundational guidelines addressing the use of perioperative nutrition, as well as related clinical outcomes.
- Highlight best practices and example pathways incorporating nutrition in perioperative care.

Healthcare Landscape

Prevalence of Malnutrition in Specific Patient Types in the Medical and Surgical ICU

Heterogenous group
37.8%-78.1%

Elderly group
23.2%-34.4%

Cardiac surgery
5.0%-20.0%

Liver transplantation
52.6%

Acute kidney injury
82.0%

Commonalities Exist Among Diagnostic Criteria for Malnutrition, Sarcopenia, and Frailty

Malnutrition¹⁻³

- Suboptimal energy intake^{^*}
- Unplanned weight loss^{^*}
- Reduced muscle mass^{^*}
- Subcutaneous fat loss[^]
- Decreased functional status (measured by grip strength)[^]
- Fluid accumulation[^]
- Body Mass Index (BMI), by age^{*}
- Disease burden or severity^{*}

Sarcopenia^{1,4}

- Low muscle strength
- Low muscle quantity or quality
- Low physical performance

Frailty⁵

- Slow gait speed
- Impaired grip strength
- Low energy expenditure
- Physical exhaustion
- Unintended weight loss

Malnutrition is Among the Few Modifiable Preoperative Risk Factors Associated with Poor Surgical Outcomes¹

At 31%, SSI are among the most common and costly healthcare associated infections (HAIs) in the US.²⁻³

Up to 65% of surgical patients are at nutrition risk. Society guidelines recommend diet optimization and oral nutrition supplementation to address malnutrition and reduce risk of surgical complications.⁴⁻⁹

Postoperative wound dehiscence and surgical site complications are associated with increased cost, LOS, and mortality.¹⁰⁻¹²

* Referenced society guidelines include those from the American Society for Enhanced Recovery, and European Society for Clinical Nutrition and Metabolism (ESPEN Guidelines for Geriatrics and Hydration and Surgery)

HAI: Hospital-Acquired Infection **LOS:** Length of Stay **SSI:** Surgical Site Infection

Identifying Risk

Average Nutritional Adequacy from an International Survey Shows Poor Intake

35% of Prescribed Calories	42% of Prescribed Protein
Frequent cessation of feeding is often due to:	Inadequate calorie and protein intake is associated with increased:
<ul style="list-style-type: none">• Gastrointestinal intolerance• Routine nursing care activities• Procedures or diagnostic tests• Technical issues with feeding access	<ul style="list-style-type: none">• Risk for infectious complications• Length of hospital stay• Mechanical ventilation• Risk of complications• Mortality

Understanding Various Clinical Presentations of Malnutrition

Malnutrition can occur in people of all body types, ages, genders and conditions:

Obesity

Elderly

Acutely or
Chronically Ill

Underweight

As Nutritional Status and Lean Body Mass (LBM) Decline, Risk of Complications Increase

“As lean mass decreases, more consumed protein is used to restore LBM, with less being available to the wound.”

Impaired immunity (infections)

10% Loss of Total Lean Body Mass

- Potential complication:
- Impaired immunity
 - Increased infection

Delayed healing

20% Loss of Total Lean Body Mass

- Potential complication:
- Decreased healing
 - Thinning of the skin

Pressure ulcers

30% Loss of Total Lean Body Mass

- Potential complication:
- New wound development
 - Pneumonia

Risk Assessment Tools

Malnutrition Screening Tool (MST)

STEP 1: Screen with the MST

1 Have you recently lost weight without trying?

No	0
Unsure	2

If yes, how much weight have you lost?

2-13 lb	1
14-23 lb	2
24-33 lb	3
34 lb or more	4
Unsure	2

Weight loss score:

2 Have you been eating poorly because of a decreased appetite?

No	0
Yes	1

Appetite score:

Add weight loss and appetite scores

MST SCORE:

STEP 2: Score to determine risk

**MST = 0 OR 1
NOT AT RISK**
Eating well with little or no weight loss

If length of stay exceeds 7 days, then rescreen, repeating weekly as needed.

**MST = 2 OR MORE
AT RISK**
Eating poorly and/or recent weight loss

Rapidly implement nutrition interventions. Perform nutrition consult within 24-72 hrs, depending on risk.

STEP 3: Intervene with nutritional support for your patients at risk of malnutrition.

Enter Patient and Surgical Information

Procedure

Begin by entering the procedure name or CPT code. One or more procedures will appear below the procedure box. You will need to click on the desired procedure to properly select it. You may also search using two words (or two partial words) by placing a '+' in between, for example: "cholecystectomy + cholangiography"

Are there other potential appropriate treatment options? ☐ Other Surgical Options ☐ Other Non-operative options ☐ None

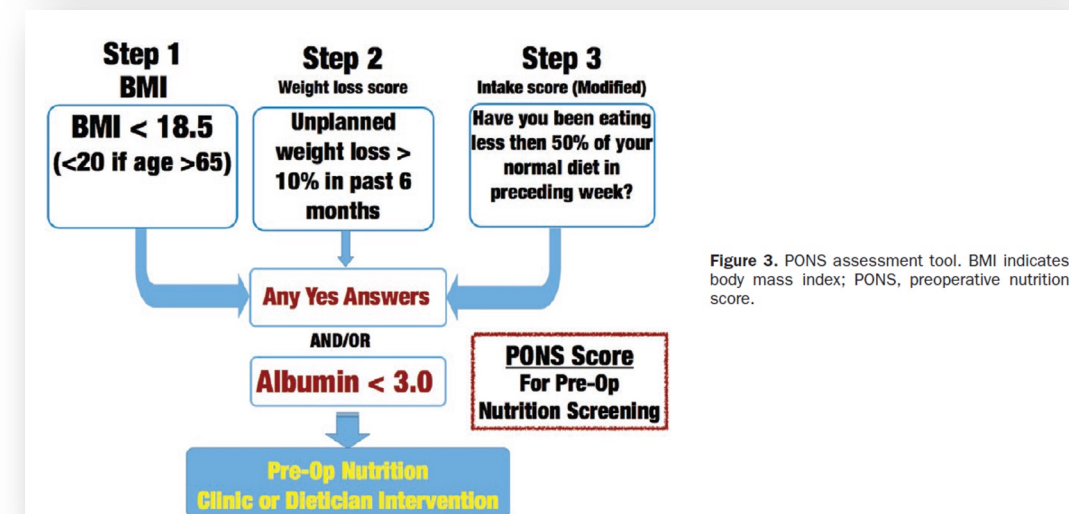

Please enter as much of the following information as you can to receive the best risk estimates.
A rough estimate will still be generated if you cannot provide all of the information below.

Age (between 18 and 112):

Sex

Diabetes

Hypertension requiring medication

Risk Stratification for Prediction of Postoperative Outcomes

Study Overview:

- Perioperative nutrition risk assessed via PONS tool, comparing key clinical outcomes to individual and composite PONS components (BMI, intake, albumin, weight loss)
- n=3,151 adult surgical patients

Results:

- Unplanned weight loss associated with 22.4% increased LOS ($P<0.0001$) and increased 30-d readmissions ($P<0.001$)
- History of suboptimal oral intake associated with 25% increased LOS ($P<0.001$)
- **Pre-operative serum albumin level <3.0 g/dL associated with 29.9% increased LOS ($P<0.001$) and increased 30-d readmission rate ($P<0.001$)**
- Low BMI not associated with increased LOS by adjusted analysis, although was predictive by univariate analysis
- **Preoperative albumin <3.5 g/dL had a greater rate of postoperative complications including organ or space SSI, MI, CVA, return to OR within 30-d, wound infection, and sepsis (all $P<0.005$).***

Surgical Services Included in PONS Validation

ERAS® OVERVIEW⁴

- Perioperative care programs are shown to improve outcomes after major surgery

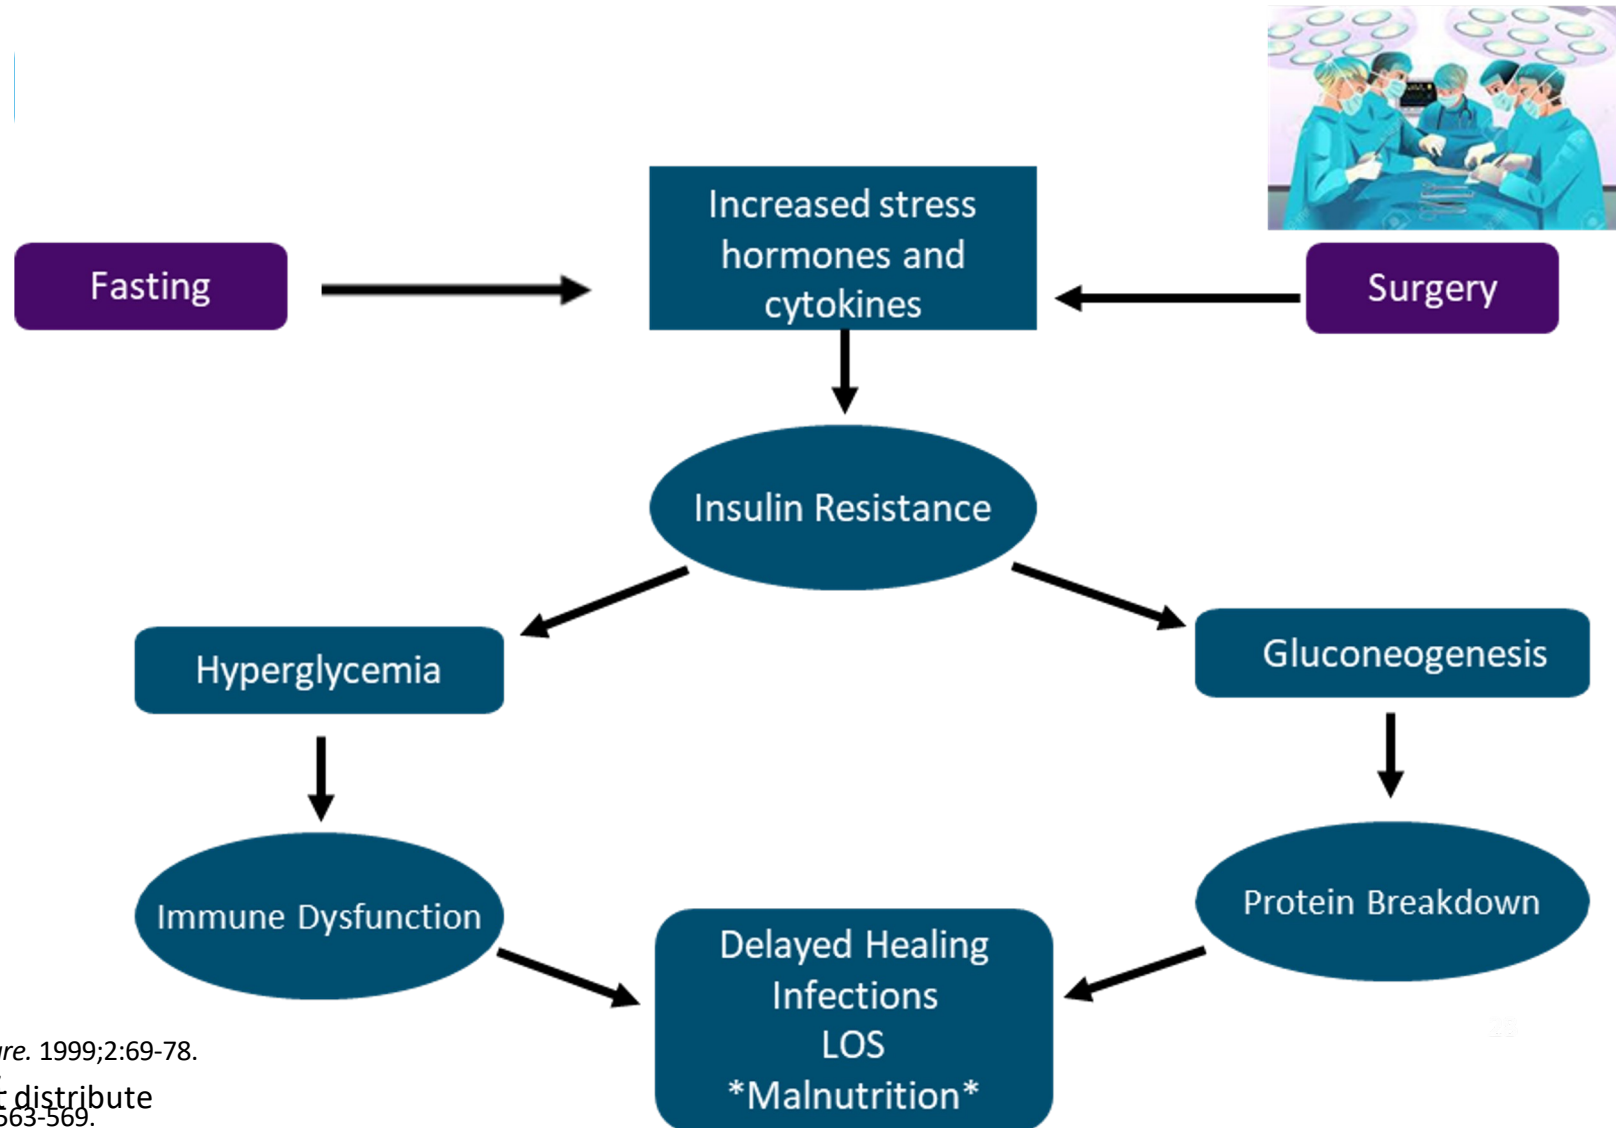

GOALS of ERAS®⁵

- Reduce the surgical stress response to improve postoperative function and recovery
- Shorten hospital LOS and reduce complications
- Preserve muscle mass²

Carbohydrate Loading Reduces Stress Hormones and Cytokines¹⁻³

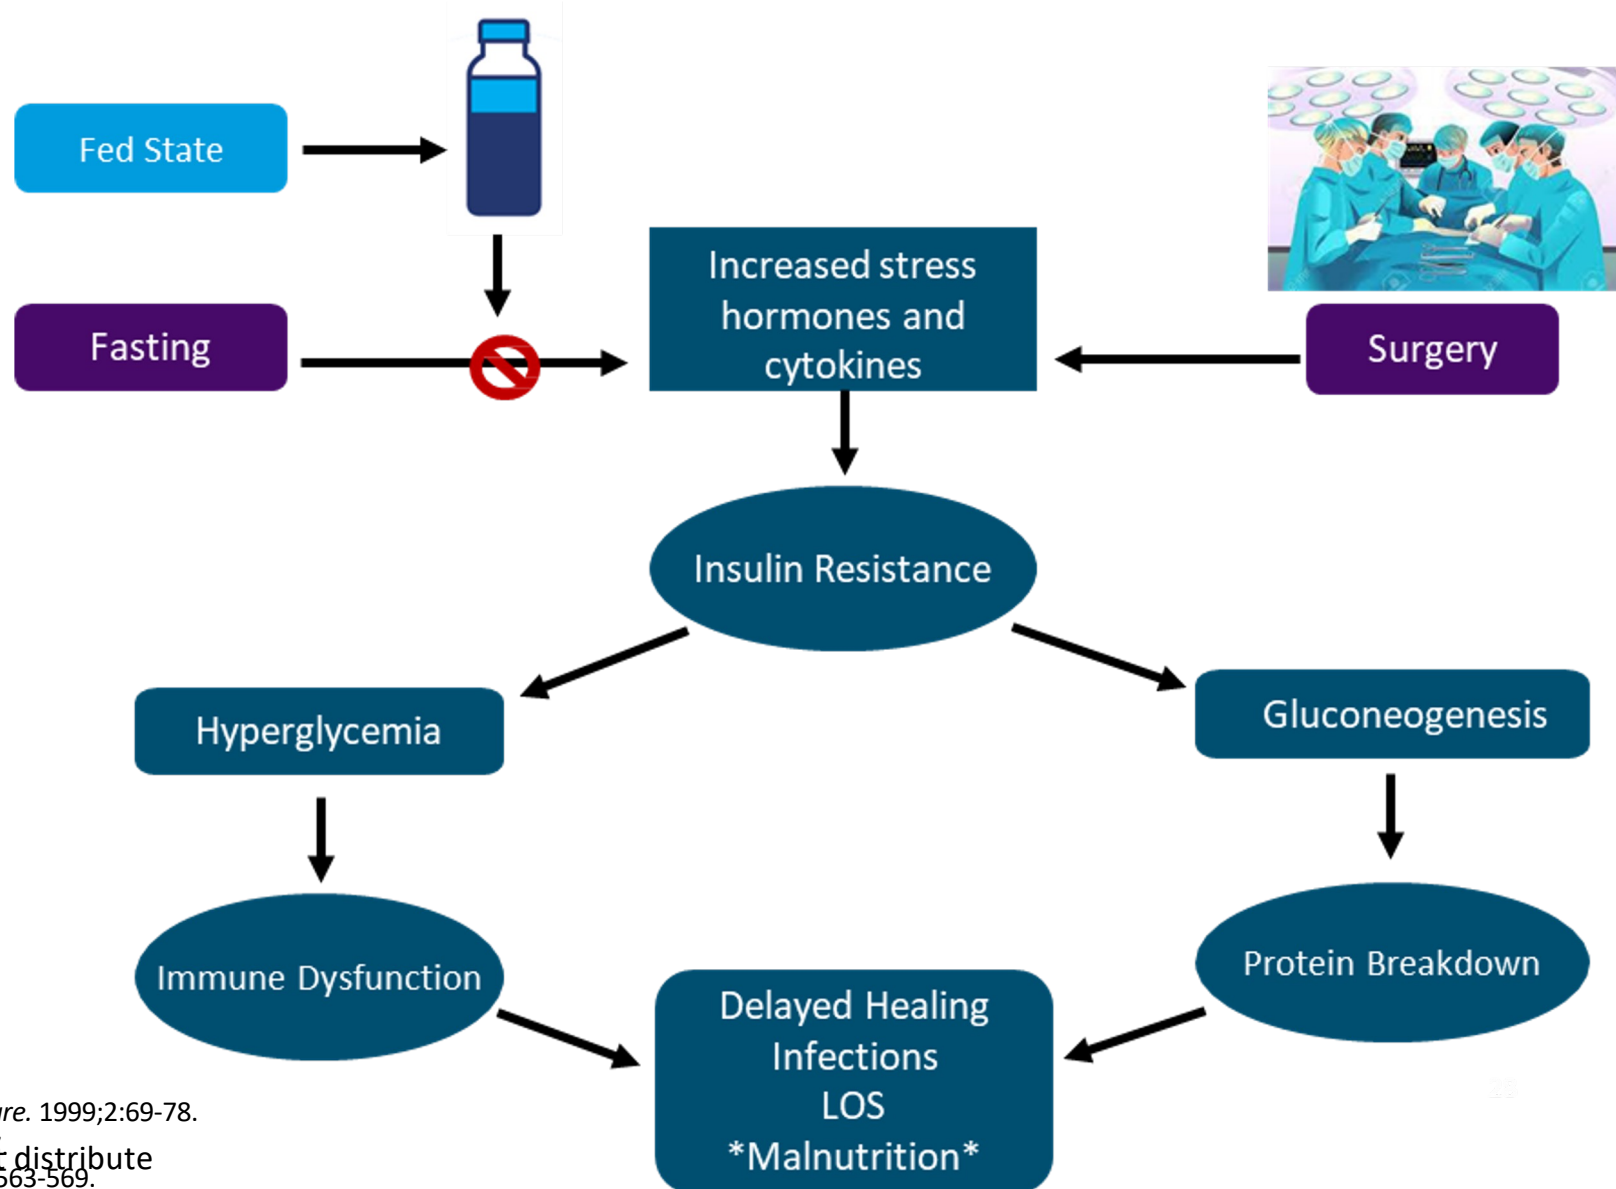

1. Thorell A, et al. *Curr Opin Clin Nutr Metab Care*. 1999;2:69-78.

2. Liungqvist O, et al. *Scand J Nutr*. 2000;44:3-7.

3. Noblett SE, et al. *Colorectal Disease*. 2006;8:563-569.

Example Carbohydrate Loading Protocol

WHAT:

~400 mL of ~12.5% complex carbohydrate (50 g dose), lower osmolality compared to typical sports drink

WHEN/HOW:

- Night before surgery, before bedtime within fasting window: 100 g complex carbohydrate (~800 mL)
- Day of: 50 g complex carbohydrate (~400 mL)
 - 2-3 h before anesthesia
 - Orally consumed within 5-10 minutes (not sipped over time)

Arginine Promotes Blood Flow and Protein Production¹

- **Stimulant for Wound Healing²**
 - Serves as an intermediate amino acid during proline synthesis, which is required for collagen synthesis
- **Nitric Oxide Production for Intracellular Signaling³**
 - Vasodilates blood vessels
 - Increases vascular permeability
- **Supports Immune Function³**
 - Is directly bactericidal
 - Used by macrophages and leukocytes to destroy pathogens

1. Mitchell KW, et al. *Clin Nutr.* 2017;36(6): 1573-1579.
2. Rosenthal MD, et al. *Int J Crit Care Emerg Med.* 2016;2(2):2474-3674.
3. Patel JJ, et al. *Nutr Clin Pract.* 2016;31(4):438-444.

Ramifications of Arginine Deficiency

Arginine production and availability are greatly reduced in critically-ill septic patients.¹⁻²

Arginine deficiency leads to T-Lymphocyte suppression³

Recurrent nosocomial infections

Poor wound healing

Skewed inflammatory markers

Critical illness leads to perpetual energy depletion³

2 molecules of adenosine triphosphate for every 1 arginine replenished³

- With nutrition supplementation this could be reversed allowing body to conserve its energy for other vital needs.³

Specific Nutrients for Skin Integrity and Wound Healing

Nutrient	Role in Skin Integrity and Healing	Recommended or Suggested Daily Intake	Proposed Benefit
Calories	Energy source	30–35 kcal/kg body weight ¹	Provide energy; preserve lean body mass (LBM)
Protein	Tissue maintenance and repair	1.2–1.5 g/kg body weight ¹	Builds LBM. Supports new tissue growth and strength
Collagen	Tissue maintenance and repair	No specific daily recommended amount	Stimulates internal collagen production
Arginine	Regulates many metabolic and physiologic functions involved in wound healing and tissue repair	17 - 24 g of arginine per day is suggested to provide benefits for wound healing ²	Supports protein synthesis needed for wound healing
Glutamine	Tissue repair and cell proliferation	0.57 g/kg is the daily suggested maximum ²	Supports protein synthesis and offsets muscle glutamine depletion
HMB	May inhibit breakdown of LBM	3 g CaHMB, along with arginine and glutamine, support collagen deposition ³	Helps maintain and rebuild lean body mass

Specific Nutrients for Skin Integrity and Wound Healing

Nutrient	Role in Skin Integrity and Healing	Recommended or Suggested Daily Intake	Proposed Benefit
Vitamin B12	Role in maintenance of red blood cells and connective tissue	RDA=2.4 mcg/day for males and females; UL=not established ¹ Supplement if deficient.	Increased tensile strength of wounds during the early phases of wound healing
Vitamin C	Connective tissue, collagen synthesis and tensile strength.	RDA=90 mg/day for males; 75 mg/day for females; UL=2000 mg/day ² Supplement if deficient.	Promotes neutrophil and fibroblast activity; Hydroxylation of proline and lysine
Vitamin E	Antioxidant	RDA=15 mg/day for males and females; UL=1000 mg/day ² Supplement if deficient.	Quenches free radicals and helps maintain membrane integrity
Zinc	Cell mediated immunity and anti-oxidant	RDA=11 mg/day for males; 8 mg/ day for females; UL=40 mg/day ³ Supplement if deficient.	Cell replication and growth and protein synthesis

Immunonutrition (IMN) in gynecological surgery for malignancy is associated with improved postoperative outcomes

Compared with a standard formula, gynecologic oncology patients who received IMN supplementation perioperatively had¹:

- Higher immunologic response via CRP and WBC in the postoperative period ($P < 0.05$)
- Lower LOS, wound infections and wound dehiscence rates ($P < 0.05$)

Among gynecologic oncology patients who underwent laparotomy, patients who received post-operative IMN ($n = 112$) had²:

- Fewer wound complications ($P = 0.049$) associated with a 78% reduction in the incidence of CDC SSI class 2 and 3 infections (OR = 0.22, CI: 0.05 - 0.95, $P = 0.044$) compared to standard diet ($n = 226$)

SSI: Surgical Site Infections

CDC: Centers for Disease Control

CRP: C-reactive protein

WBC: White blood cell count

Preoperative Oral Arginine and Glutamine are Associated with Decreased Fistula Recurrence, Infectious Complications, and Postoperative Inflammation

Objective:

- To determine the effect of preoperative enteral glutamine and arginine in the surgical repair of enterocutaneous fistula (ECF)

Design:

- A prospective, randomized trial (n=40)
 - **The experimental group** (n=20) received the standard of care and supplemental arginine (4.5 g) and glutamine (10 g) preoperatively for 7 days
 - **The control group** (n=20) received the standard of care

Primary endpoint: ECF recurrence

Secondary endpoints: serum concentrations of interleukin-6, serum C-reactive protein, and infectious complications (urinary tract infection, central line infection, and bacteremia)

Preoperative Oral Arginine and Glutamine are Associated with Decreased Fistula Recurrence, Infectious Complications, and Postoperative Inflammation

Selected Results:

	Control Group (n=20)	Experimental group (n=20)	P-value for Univariate Analysis
Fistula recurrence	9	2	0.031
Infectious complications	6	0	0.026
Number of infectious complications	13	0	0.000
Postoperative stay	90.0 (148.8)	15.1 (6.88)	0.028
Death	2	1	1.000

Supplemental arginine and glutamine showed significant differences in IL-6 and CRP when compared to the control group the day before definitive surgery ($P<0.05$) and on postoperative days 1,3 and 7 ($P<0.01$)

Perioperative immunonutrition (IMN) is associated with better outcomes vs. standard nutrition¹

Impact of an Interdisciplinary Malnutrition Quality Improvement Project at a Large Metropolitan Hospital

The objective of this project was to make a series of institution-wide care improvements for patients who are malnourished or at risk of malnutrition to reduce LOS, infection rates, and 30-day hospital readmissions.

Use of the MQii toolkit among patients with/at risk for malnutrition led to:

25% overall reduction in LOS for malnourished/ at-risk patients (from 8 days to 6 days, $P < 0.01$)

35.7% decline in infection rates among malnourished patients (from 14 to 9%, $P < 0.01$)

No significant difference between pre- and post-intervention groups for 30–60-day readmission rates. ($P = 0.58$)

The staff and researchers believe that the QI infrastructure provided by this focus on malnutrition care not only showcased the improvement in malnutrition care gaps, but also resulted in creating an environment that will ensure the uptake and adoption of future nutrition-focused initiatives across delivery settings.

AND: Evidence-based Nutrition Practice Guidelines – Malnutrition in Older Adults

Summary of Recommendations:

- Use a validated screening tool to identify nutritional risk

- Consider food fortification to improve intake and nutritional status

- Recommend home-delivered meals and referrals to congregate meal sites for older adults living in the community, especially those considered malnutrition or at risk

- Incorporate oral nutrition supplements (ONS) as part of an individualized and comprehensive nutrition intervention for older adults with malnutrition risk discharged from acute care to the community

- Offer ONS 1 – 2 times per day to meet caloric and protein deficits

- Include a registered dietitian at every level of care (i.e., acute care discharge, community)

Trauma and Wound Complications

\$37B

The annual cost of national inpatient trauma care is estimated at \$37 billion.¹⁻²

10-30%

Approximately 10% of trauma patients develop wound infections, increasing to 30% among those who spend >48 hours in the ICU.³

10%

Infections are the leading cause of late organ failure and potentially contribute to 10% of all trauma-related deaths.³

Wound healing is a physiological process required for maintenance of an intact skin barrier. The role of nutrition, both in promoting healing and avoiding complications associated with trauma, has long been acknowledged in acute care surgery; however, it is often neglected.³

Critical Care Guidelines¹

SURGICAL SUBSETS

TRAUMA

M1b: Use of immune-modulating formulations containing arginine and FO is suggested for patients with severe trauma

POSTOPERATIVE SICU

O3: Suggest use of an immune-modulating formula [containing both arginine and fish oils] for the postoperative patient requiring EN therapy

PERIOPERATIVE SICU

E2, O3: Immune-modulating formulations [arginine with other agents including EPA, DHA, glutamine, nucleic acid] should be considered perioperatively for SICU patients

TRAUMATIC BRAIN INJURY (TBI)

E2, M2b: In patients with TBI, consideration of immune-modulating formulations [arginine with other agents including EPA, DHA, glutamine, nucleic acid] is suggested

Dietary Fiber And Enteral Feeding Intolerance And Clinical Outcomes In Patients With Critical Illness

Design

Meta-analysis of 13 RCTs ($n = 709$) on the association between fiber-containing enteral feeding with enteral feeding intolerance and hospital outcomes in patients with critical illness

Beneficial Effects of Prebiotics on GI Health¹⁻²

“A dietary prebiotic is a selectively fermented ingredient that results in specific changes, in the composition and/or activity of the gastrointestinal microbiota, thus conferring benefit(s) upon host health.”¹

Prebiotics expand the growth/activity of beneficial bacteria resulting in:²

- Inhibition of growth of exogenous and/or harmful bacteria
- Stimulation of immune functions
- Aid in digestion and/or absorption of food ingredients/minerals
- Synthesis of vitamins

Use of Arginine/Glutamine/HMB in Surgical Recovery

Malafarina, et al. 2017¹

- HMB-enriched ONS BID in elderly patients with **sarcopenia, post hip fracture**.
- BMI and appendicular lean mass stable in HMB group while these parameters decreased in the control group (standard diet).
- Concentration of proteins and vitamin D increased more in the HMB group vs. the control group.

Nishizaki, et al. 2015²

- ARG/GLN/HMB drink BID x 5d pre-op + 28d post Elective TKA
- Quadriceps muscle strength was maintained in TKA patients receiving the intervention drink
- Counterparts receiving orange juice placebo had significant reduction in muscle strength between preop and 14 days

Norouzi, et al. 2022³

- ARG/GLN/HMB BID x 30d preop **cardiac surgery**
- SOFA score lower in AA group (2 vs. 5); lower levels of cTN, CPK-MB, and bilirubin
- LOS ~1 day shorter in AA group
- Preop “supplementation with ARG/GLN/HMB enhances the recovery, reduces myocardial injury and decreases time in hospital”

Hendrickson, et al. 2022⁴

- **Pelvic and extremity fractures;** CEAA's BID (Juven) x 2 weeks vs. standard nutrition control
- CEAA group had lower overall complications vs. control
- Fat free mass decreased significantly at 6 weeks in control (-9 kg, p = 0.025) vs. maintenance in CEAA subjects (NS)

NUTRITION TO HELP YOU PREPARE FOR AND RECOVER FROM SURGERY

PIVOT® 1.5 CAL

For patients requiring tube feeding, Pivot® 1.5 Cal may be used as a source of perioperative immunonutrition.

Use under medical supervision.
* Two servings of Juven® daily provide a recommended level of HMB.

Juven[®] : Therapeutic Nutrition for Wound Healing

- Clinically shown to support wound healing by enhancing collagen production in as little as 2 weeks,^{1,3}
- Clinically shown to build lean body mass in 4 weeks^{‡,2}
- Formula Includes
 - Arginine
 - Glutamine
 - HMB
 - Hydrolyzed collagen protein
 - Micronutrients

Use under medical supervision in addition to a complete, balanced diet

FUELING UP FOR SURGERY:
HOW NUTRITION CAN HELP TO SUPPORT RECOVERY

Undergoing surgery is a lot like running a marathon. For both, your body requires proper nutrition in the weeks and days before and after for the best recovery.

An adult undergoing surgery may experience:¹⁻³

- INFLAMMATION AND LOWERED IMMUNITY
- ELEVATED BLOOD SUGAR
- INCREASED PROTEIN AND ENERGY NEEDS
- UNINTENDED WEIGHT LOSS
- LOSS OF MUSCLE STRENGTH AND DELAYED WOUND HEALING

FUELING UP FOR SURGERY:
HOW NUTRITION CAN HELP TO SUPPORT RECOVERY

Your healthcare provider suggests the following schedule:

BEFORE SURGERY

Ensure® Surgery: an immunonutrition shake specially designed to support immune health and recovery from surgery

DATE(S):

☐ yes ☐ no

shake, _____ times per day, for _____ days.

Ensure® Pre-Surgery: A clear, complex carbohydrate drink specially designed to improve patient outcomes

DATE:

☐ yes ☐ no

bottle(s) the night before surgery, within fasting window. Consume drink within _____ minutes.

DAY OF SURGERY

Ensure® Pre-Surgery: A clear, complex carbohydrate drink specially designed to improve patient outcomes

DATE:

TIME:

☐ yes ☐ no

bottle up to _____ hours before surgery. Consume drink within _____ minutes.

AFTER SURGERY

Ensure® Surgery: an immunonutrition shake specially designed to support immune health and recovery from surgery

DATE(S):

☐ yes ☐ no

shake, _____ times per day, for _____ days.

For maintaining body weight and rebuilding muscle and strength

Ensure® Surgery: advanced nutrition with an All-in-One blend, including protein and HMB for muscle health. Excellent source of omega-3 fatty acid (ALA) to support heart health.

☐ yes ☐ no

shakes per day, for _____ days.

For wound healing

Ensure® Surgery: A unique blend of arginine, glutamine, protein and HMB to support collagen formation and lean body mass needed for wound healing.¹²

☐ yes ☐ no

packets per day, for _____ days.

YOUR WOUND CARE NUTRITION PLAN

Your Health Care Provider has recommended using Juven® twice a day for 30 days.

- Juven should be mixed with 8-10 fl oz of water or other liquid (Juven is best when mixed at room temperature).
- Juven can be mixed with juices, yogurt, applesauce, ice cream or other foods to add variety to your diet.

Juven helps build new tissue when you need it most – after injury or surgery

JUVEN® IS A THERAPEUTIC NUTRITION POWDER WITH POWERFUL INGREDIENTS FOR OPTIMAL WOUND HEALING

EASY WAYS TO ENJOY JUVEN®

Here are a few single-serving ideas for incorporating 2 packets of Juven per day into your balanced diet.

Juven Spritzer
Makes 1 serving
Ingredients:

- 1 package Orange Juven
- 1 1/2 cup of club soda, gingerale, or lemon-lime soda*
- Crushed ice (optional)

Directions:
Sift Juven into 3-4 ounces of your chosen soda until powder is dissolved. Pour in the remaining portion of liquid. Stir gently. Add ice if desired.

Orange Cranberry Crush
Makes 1 serving
Ingredients:

- 1 package Orange Juven
- 1/4 cup water
- 1/2 cup regular or light cranberry juice
- 150g fresh lime juice, or to taste Crushed ice
- 1/2 cup gingerale, regular or diet
- Lime wedges, orange wedges, or cranberries for garnish

Directions:
Dissolve the Juven in 1/4 cup of water with the water, cranberry juice and lime juice. Fill the glass with ice, pour gingerale over ice, and stir. Garnish as desired and serve.

Use Juven under medical supervision in addition to a complete balanced diet.

SUMMARY

Currently, there is a lack of consensus on the provision of preoperative carbohydrate loading in patients with type 2 diabetes mellitus (T2DM) due to theoretical concerns including the possibility of delayed gastric emptying, perioperative hyperglycemia, and poor surgical outcomes. This narrative review summarizes the accumulating evidence on preoperative carbohydrate loading in this population and whether these concerns are supported by preliminary evidence. In general, the available research suggests that carbohydrate loading may be implemented in those with T2DM without increased risk for intra- and postoperative hyperglycemia or surgical complications. However, there is strong justification for future research to definitively study this highly debated and timely topic. Ultimately, the inclusion of preoperative carbohydrate loading for surgical patients with DM should be guided by the surgical team's clinical judgment and individualized based on patient needs and characteristics.

Summary & Next Steps

Malnutrition and deconditioning are prevalent in patients undergoing various types of elective and even emergent surgery.¹

Preoperative carbohydrate loading is associated with reduced postoperative insulin resistance, decrease LOS, and improve patients' well-being pre- and postoperatively.¹

Investing in a perioperative QI program has been associated with significant savings associated with reduced LOS and reduced complications, as well as improving upon patient-centered outcomes and patient satisfaction.¹⁻³

Studies incorporating *arginine*, *glutamine*, and *HMB* as part of a comprehensive perioperative intervention demonstrated improvements in functional status and complications (wound healing, infectious, etc.).²⁻⁵

Consider evaluating current order sets & perioperative pathways for inclusion of evidence-based nutrition.
