

# **NHSN Surgical Definitions**

Cheryl Richardson, RN, BSN, CIC

# ***Conflict of Interest and Disclosure of Financial Relationships***

- I'm an employee of CareFusion.
- No financial or in-kind contributions have been given by a commercial interest to pay all or part of the cost of this educational activity.
- I do not plan to discuss any unlabeled or investigational uses of products during this educational activity.

# Objectives

Upon completion of this program, participants will be able to:

- Utilize NHSN definitions to identify SSIs
- Identify SSI surveillance changes for 2015
- Apply NHSN SSI definitions to patient case studies

# Surgical Procedure Denominator Forms

# Transition to ICD-10-CM/PCS codes

- CDC continues to work on updated ICD-10-CM/PCS and CPT mappings. These mappings are anticipated to be available by March 2015.
- ICD-10-CM/PCS codes will replace ICD-9-CM codes on October 1, 2015 but NHSN will not have the ability to receive these codes until the January 2016 release.
- For the last quarter of 2015 enter the NHSN Procedure Code (e.g. COLO or HYST) but do not enter any ICD-10-CM/PCS codes associated with the procedure.

New NHSN Newsletter Format!	
Volume 9, Issue 3 September 2014	Based on user feedback, NHSN has modified the NHSN Newsletter format to make it easier for users to navigate to the appropriate articles for their facility type and NHSN Component participation. The Newsletter has been split into NHSN Component-specific sections: Patient Safety, Long Term Care Facility, Healthcare Personnel Safety, Dialysis, Biovigilance, and general NHSN information. Users can use the direct links in the Table of Contents below to navigate to the exact section of the Newsletter they wish to read.
Inside this issue:	
<b>Patient Safety Component</b>	<b>2</b>
Reminder! Data for CMS Quality Reporting Programs due Soon!	2
New NHSN Reporting to fulfill CMS Quality Reporting Programs	2
HAI Surveillance Changes for 2015	4
BSI Changes	3
UTI Changes	6
Reducing NHSN Data Collection Burden	6

## Instructions for Completion of Denominator for Procedure Form (CDC 57.121)

This form is used for reporting data on each patient having one of the NHSN operative procedures selected for monitoring.

Data Field	Instructions for Data Collection
Facility ID	The NHSN-assigned facility ID will be auto-entered by the computer.
Procedure #	The NHSN-assigned Procedure # will be auto-entered by the computer.
Patient ID	Required. Enter the alphanumeric patient ID number. This is the patient identifier assigned by the hospital and may consist of any combination of numbers and/or letters.
Social Security #	Optional. Enter the 9-digit numeric patient Social Security Number.
Secondary ID #	Optional. Enter the alphanumeric ID number assigned by the facility.
Medicare #	Optional. Enter the patient's Medicare number.
Patient name	Optional. Enter the last, first, and middle name of the patient.
Gender	Required. Check Female, Male, or Other to indicate the gender of the patient.
Date of birth	Required. Record the date of the patient birth using this format: MM/DD/YYYY.
Ethnicity	Optional. Hispanic or Latino If patient is Hispanic or Latino, check this box. Not Hispanic or Not Latino If patient is not Hispanic or not Latino, check this box.
Race	Optional. Check all the boxes that apply to identify the patient's race.
Event type	Required. Enter the code for procedure (PROC).
NHSN Procedure code	Required. Enter the appropriate NHSN procedure code.
Date of procedure	Required. Record the date when the NHSN procedure was done using this format: MM/DD/YYYY.

## Denominator for Procedure

*Weight: _____ lbs/kg (circle one)		
CSEC: *Duration of Labor: _____ hours		

# Wound Class

- Must be assessed at the time of the operation by a person present during the surgical procedure
  - e.g., surgeon, circulating nurse, etc.
- Wound class assignment prior to surgery will lead to both inaccurate reporting and inaccurate risk adjustment!

## Wound Class

### Clean

Operation where no inflammation encountered

Respiratory, alimentary, genital, urinary tracts **not** entered

Operation following non-penetrating (blunt) trauma

Primarily closed with no open drainage

### Clean - Contaminated

Operation entering respiratory, alimentary, genital, or urinary tracts

No evidence of infection, no major break in technique, no unusual contamination encountered

Operation involving biliary tract, appendix, vagina, and oropharynx

### Contaminated

Operation following open, fresh, accidental wounds

Operation with major breaks in sterile technique (e.g., open cardiac massage) or gross spillage from GI tract

Includes operation where acute, non-purulent inflammation encountered

### Dirty

Operation involving old traumatic wounds with retained devitalized tissue, **or** existing clinical infection **or** perforated viscera

Definition suggests the organisms causing post-op infection were present before the operation

# Diabetes

- “YES” if:
  - The patient has a diagnosis of diabetes requiring management with insulin or a non-insulin anti-diabetic agent. This includes patients with “insulin resistance” who are on management with an anti-diabetic agent. This also includes patients with a diagnosis of diabetes requiring management with an anti-diabetic agent, but who are noted to be non-compliant with their prescribed medications.
- “NO” if:
  - The patient has no known diagnosis of diabetes, or a diagnosis of diabetes that is controlled by diet alone. Also indicate N if the patient receives insulin for perioperative control of hyperglycemia but has no diagnosis of diabetes

# Incisional Closure

**NO LONGER** a part of the NHSN operative procedure definition.

## Non-Primary Closure may Include

- Superficial layers (skin) left completely open
- Deep may be closed by some means (partially) with superficial left open
- Deep and superficial left completely open
- Fascial layers or deep fascia closed with skin left open
- Open abdomen
- Deep fascial levels left open with skin closed
- Plans to be closed (secondarily) at a later date
- Surgical incision is expected to heal by secondary intention
  - May or may not have wound vacs or packing
  - may also have wires wicks or drains

## Primary Closure may Include

- Closure at all levels of tissue (fascia is closed)
- Any portion at skin level is closed, if the fascia has been closed even if partially it should be considered primarily closed
  - Loosely closed at skin level
  - Left open at bottom for drainage purposes
  - May have wires wicks or drains
  - May have packing
  - May have wound VAC

# Wound Closure Examples

# Closure Technique

- *If any part of the skin is sutured (the epidermis, the dermis, or the hypodermis/subcutis), would it be considered a primary closure?*
- **NHSN answer:** *This would not be a primary closure because at no point are the skin edges approximated.*

# Closure Technique

- *If any part of the incision is approximated, but one part is left open would it be considered a primary closure?*
- **NHSN Answer:** *Yes, that would be a primary closure. The skin is approximated for much of the wound area. Even if it were more open than this but that at some point it is closed at the skin level it is a primary closure.*

CDC 57.121 Rev. 6, NHSN v8.1

# HPRO Mapping

- 81.51: HPRO -> Total -> Total Primary
- 81.52: HPRO -> Hemi -> Partial Primary
- 81.53: HPRO -> Total -> Total Revision
- 00.70: HPRO -> Total -> Total Revision
- 00.71-00.73: HPRO -> HEMI -> Partial Revision
- 00.85: HPRO -> Resurfacing -> Total Primary
- 00.86-00.87: HPRO -> Resurfacing -> Partial Primary

# KPRO Mapping

- 81.54: KPRO -> Total -> Total Primary
- 81.55: KPRO -> Total -> Total Revision
- 00.80: KPRO -> Total -> Total Revision
- 00.81-00.84: KPRO -> Hemi -> Partial Revision

## HPRO and KPRO Revision Procedures

If total or partial revision HPRO or KPRO is performed, evaluate if any of the following ICD-9 diagnosis or procedure codes (below) were coded in the 90 days prior to and including the index HPRO or KPRO revision.

# HPRO and KPRO

## Revision Procedures (cont)

- If any of the specified codes are recorded, mark yes to the data field “...was the revision associated with prior infection at index joint?”
- This variable is defined solely by the presence of one or more of the following ICD-9 codes associated with the index HPRO or KPRO procedure in the 90-day preoperative (including index revision) period.
- This will be a new Yes/No field on the Denominator for Procedure form.

# HPRO and KPRO

## Revision Procedures (cont)

- 84.56 - Insertion or replacement of (cement) spacer
- 84.57 - Removal of (cement) spacer
- V88.21 - Acquired absence of hip joint, with or without the presence of an antibiotic-impregnated spacer
- V88.22 - Acquired absence of knee joint, with or without the presence of an antibiotic-impregnated spacer

# HPRO and KPRO

## Revision Procedures (cont)

- Complications peculiar to certain specified procedures, infection and inflammatory reaction due to internal prosthetic device, implant and graft (extensions of 996, 996.6):
  - 996.60 - Due to unspecified device, implant and graft
  - 996.66 - Due to internal joint prosthesis
  - 996.67 - Due to other internal orthopedic device, implant, and graft
  - 996.69 - Due to other internal prosthetic device, implant, and graft

## HPRO and KPRO Revision Procedures (cont)

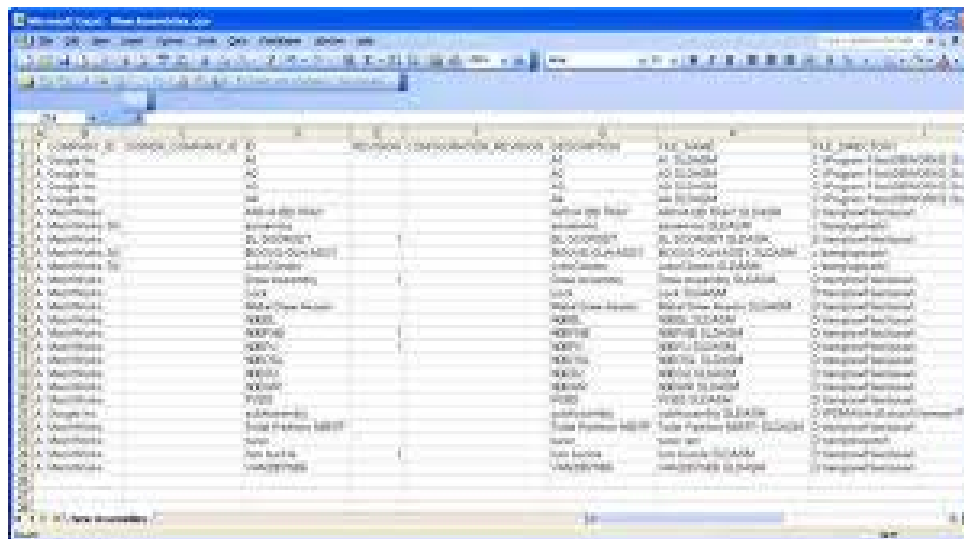

- The prior infection at index joint field will be used as a new risk factor to be considered in the risk adjustment models for the new HPRO and KPRO 2015 baselines.

- Any appendectomy (APPY) should be reported regardless of whether it is incidental.
- Any exploratory laparotomy (XLAP) should be reported regardless of whether it results in a procedure from another category being performed.

# Importing Procedure Data

- If importing procedure data using a .csv file, note that the file specifications have been updated in order to accommodate the changes to the procedure denominator form.

The screenshot shows a spreadsheet application window with a table containing data. The table has several columns, including what appears to be a list of procedure names or codes on the left, and various numerical or categorical values in the other columns. The data is organized in a grid format, typical of a spreadsheet.

# NHSN Recommended SSI Surveillance Methods

- Direct examination of wounds
- Review of medical records
- Surgeon surveys by mail or telephone
- Patient surveys by mail or telephone

- Know the HAI surveillance definitions (refer to them often !)
- Apply definitions with confidence the same way every time
- Seek assistance for ambiguity\*

### Surgical Site Infection (SSI) Event

**Introduction:** In 2010, an estimated 16 million operative procedures were performed in acute care hospitals in the United States [1]. A recent prevalence study found that SSIs were the most common healthcare-associated infection, accounting for 31% of all HAIs among hospitalized patients [2]. NHSN data for 2006-2008 (16,147 SSIs following 849,659 operative procedures) showed an overall SSI rate of 1.9% [3].

While advances have been made in infection control practices, including improved operating room ventilation, sterilization methods, barriers, surgical technique, and availability of antimicrobial prophylaxis, SSIs remain a substantial cause of morbidity, prolonged hospitalization, and death. SSI is associated with a mortality rate of 3%, and 75% of SSI-associated deaths are directly attributable to the SSI [4].

Surveillance of SSI with feedback of appropriate data to surgeons has been shown to be an important component of strategies to reduce SSI risk [5-8]. A successful surveillance program includes the use of epidemiologically-sound infection definitions and effective surveillance methods, stratification of SSI rates according to risk factors associated with SSI development, and data feedback [6, 7]. A new CDC and Healthcare Infection Control Practices Advisory Committee guideline for the prevention of surgical site infection is scheduled for publication in 2014, and will replace the previous *Guideline for Prevention of Surgical Site Infection, 1999* [8].

**Settings:** Surveillance of surgical patients will occur in any inpatient and/or outpatient setting where the selected NHSN operative procedure(s) are performed.

**Requirements:** Perform surveillance for SSI following at least one NHSN operative procedure category (Table 1) as indicated in the *Patient Safety Monthly Reporting Plan (CDC 57.106)*. Collect SSI (numerator) and operative procedure category (denominator) data on all procedures included in the selected procedure categories for at least one month to meet NHSN requirements, or as otherwise specified by state or federal reporting requirements. A procedure must meet the NHSN definition of an operative procedure in order to be included in the surveillance.

SSI monitoring requires active, patient-based, prospective surveillance. Post-discharge and ante-discharge surveillance methods should be used to detect SSIs following inpatient and outpatient operative procedures. These methods include 1) direct examination of patients' wounds during follow-up visits to either surgery clinics or physicians' offices, 2) review of medical records or surgery clinic patient records, 3) surgeon surveys by mail or telephone, and 4) patient surveys by mail or telephone (though patients may have a difficult time assessing their infections). Any combination of these methods is acceptable for use; however, CDC criteria for SSI must be used. To minimize Infection Preventionists' (IPs) workload of collecting denominator data, operating room data may be downloaded (see file specifications at: [http://www.cdc.gov/nhsn/PDFs/ImportingProcedureData\\_current.pdf](http://www.cdc.gov/nhsn/PDFs/ImportingProcedureData_current.pdf)).

## **Complete case - finding requires a comprehensive evaluation of a minimum clinical data set**

### **Step #1 (Always)**

- Identify and review:
  - All returns to OR
  - All post-op hospital readmissions (30d or 90d)
  - ICD9 post-op diagnosis and procedure “flag” codes

### **Step #2**

- Realize that culture based surveillance alone misses 50%-60% of SSIs
- Consider review of post-op imaging, such as CT/MRI

# Post-Operative ICD-9 Procedure Codes for “Flagging” Possible COLO SSI

## ICD9 Procedure Codes That **MIGHT** Indicate a Colon SSI

54.0	Incision and drainage (I&D) of abdominal wall
54.11	Exploratory laparotomy
54.19	Drainage of intraperitoneal abscess or hematoma
86.04	Skin and subcutaneous I&D NEC
86.22	Excision debridement of wound, infection, burn
86.28	Non-excision debridement of wound, infection, burn

# Post-Operative ICD-9 Diagnosis Codes for “Flagging” Possible COLO SSI

## ICD-9 Diagnosis Codes That **MIGHT** Indicate a Colon SSI

567.21, 567.22	Intra-abdominal abscess, intra-or retroperitoneal abscess
567.29	Other suppurative peritonitis
567.38	Pelvic abscess
569.5	Intestinal abscess
569.61	Infection of colostomy or enterotomy
569.81	Fistula of intestine
682.2	Abdominal wall abscess, cellulitis of trunk

# Post-Operative ICD-9 Diagnosis Codes for “Flagging” Possible COLO SSI

## ICD-9 Diagnosis Codes That MIGHT Indicate a Colon SSI (cont)

879.9	Open wound of unspecified site, complicated
998.31, 998.32	Disruption of internal or external surgical wound
998.51	Postoperative infection, seroma
998.59	Postoperative infection, abscess
998.6	Non-healing surgical wound, persistent post op fistula

# Post-Operative ICD-9 Diagnosis Codes for “Flagging” Possible HYST SSI

## ICD-9 Diagnosis Codes That **MIGHT** Indicate a HYST SSI

567.21, 567.22	Peritonitis, intra-abdominal abscess, intraperitoneal or retroperitoneal abscess
567.29	Other suppurative peritonitis
682.2	Abdominal wall abscess, cellulitis of trunk
998.31, 998.32	Disruption of internal or external surgical wound
998.51	Postoperative infection, seroma
998.59	Postoperative infection, abscess

# Superficial Incisional SSI

<p><b>Comments</b></p>	<p>There are two specific types of superficial incisional SSIs:</p> <ol style="list-style-type: none"> <li>1. Superficial Incisional Primary (SIP) – a superficial incisional SSI that is identified in the primary incision in a patient that has had an operation with one or more incisions (e.g., C-section incision or chest incision for CBGB)</li> <li>2. Superficial Incisional Secondary (SIS) – a superficial incisional SSI that is identified in the secondary incision in a patient that has had an operation with more than one incision (e.g., donor site incision for CBGB)</li> </ol>
<p><b>REPORTING INSTRUCTIONS for Superficial SSI</b></p>	<p><u>The following do not qualify as criteria for meeting the NHSN definition of superficial SSI:</u></p> <ul style="list-style-type: none"> <li>• A stitch abscess alone (minimal inflammation and discharge confined to the points of suture penetration)</li> <li>• A localized stab wound or pin site infection. While it would be considered either a skin (SKIN) or soft tissue (ST) infection, depending on its depth, it is not reportable under this module.</li> </ul>
	<ul style="list-style-type: none"> <li>• Diagnosis of “cellulitis”, by itself, does not meet criterion d for superficial incisional SSI.</li> <li>• Circumcision is not an NHSN operative procedure. An infected circumcision site in newborns is classified as CIRC and is not reportable under this module.</li> <li>• An infected burn wound is classified as BURN and is not reportable under this module.</li> </ul>

# Deep Incisional SSI

	<p><b>Deep incisional SSI</b> Must meet the following criteria:</p>
	<p>Infection occurs within 30 or 90 days after the NHSN operative procedure (where day 1 = the procedure date) according to the list in <a href="#">Table 3</a> <i>and</i> involves deep soft tissues of the incision (e.g., fascial and muscle layers) <i>and</i> patient has at least one of the following:</p> <ul style="list-style-type: none"> <li>a. purulent drainage from the deep incision.</li> <li>b. a deep incision that spontaneously dehisces or is deliberately opened by a surgeon, attending physician** or other designee and is culture-positive or not cultured <i>and</i> patient has at least one of the following signs or symptoms: fever (&gt;38°C); localized pain or tenderness. A culture-negative finding does not meet this criterion.</li> <li>c. an abscess or other evidence of infection involving the deep incision that is detected on direct examination, during invasive procedure, or by histopathologic examination or imaging test.</li> </ul> <p>** The term attending physician for the purposes of application of the NHSN SSI criteria may be interpreted to mean the surgeon(s), infectious disease, other physician on the case, emergency physician or physician's designee (nurse practitioner or physician's assistant).</p>
<b>Comments</b>	<p>There are two specific types of deep incisional SSIs:</p> <ol style="list-style-type: none"> <li>1. Deep Incisional Primary (DIP) – a deep incisional SSI that is identified in a primary incision in a patient that has had an operation with one or more incisions (e.g., C-section incision or chest incision for CBGB)</li> <li>2. Deep Incisional Secondary (DIS) – a deep incisional SSI that is identified in the secondary incision in a patient that has had an operation with more than one incision (e.g., donor site incision for CBGB)</li> </ol>

# 30-day Surveillance

## Table 3

30-day Surveillance			
Code	Operative Procedure	Code	Operative Procedure
AAA	Abdominal aortic aneurysm repair	LAM	Laminectomy
AMP	Limb amputation	LTP	Liver transplant
APPY	Appendix surgery	NECK	Neck surgery
AVSD	Shunt for dialysis	NEPH	Kidney surgery
BILI	Bile duct, liver or pancreatic surgery	OVRY	Ovarian surgery
CEA	Carotid endarterectomy	PRST	Prostate surgery
CHOL	Gallbladder surgery	REC	Rectal surgery
COLO	Colon surgery	SB	Small bowel surgery
CSEC	Cesarean section	SPLE	Spleen surgery
GAST	Gastric surgery	THOR	Thoracic surgery
HTP	Heart transplant	THYR	Thyroid and/or parathyroid surgery
HYST	Abdominal hysterectomy	VHYS	Vaginal hysterectomy
KTP	Kidney transplant	XLAP	Exploratory Laparotomy
		OTH	Other operative procedures not included in the NHSN categories

# 90-day Surveillance

## Table 3

90-day Surveillance	
Code	Operative Procedure
BRST	Breast surgery
CARD	Cardiac surgery
CBGB	Coronary artery bypass graft with both chest and donor site incisions
CBGC	Coronary artery bypass graft with chest incision only
CRAN	Craniotomy
FUSN	Spinal fusion
FX	Open reduction of fracture
HER	Hemiorrhaphy
HPRO	Hip prosthesis
KPRO	Knee prosthesis
PACE	Pacemaker surgery
PVBY	Peripheral vascular bypass surgery
RFUSN	Refusion of spine
VSHN	Ventricular shunt

# Organ/Space SSI

	<b>Organ/Space SSI</b> Must meet the following criteria:
	<p>Infection occurs within 30 or 90 days after the NHSN operative procedure (where day 1 = the procedure date) according to the list in <a href="#">Table 3</a></p> <p><i>and</i></p> <p>infection involves any part of the body, excluding the skin incision, fascia, or muscle layers, that is opened or manipulated during the operative procedure</p> <p><i>and</i></p> <p>patient has at least one of the following:</p> <ul style="list-style-type: none"><li>a. purulent drainage from a drain that is placed into the organ/space</li><li>b. organisms isolated from an aseptically-obtained culture of fluid or tissue in the organ/space</li><li>c. an abscess or other evidence of infection involving the organ/space that is detected on direct examination, during invasive procedure, or by histopathologic examination or imaging test</li></ul> <p><i>and</i></p> <p>meets at least one criterion for a specific organ/space infection site listed in <a href="#">Table 4</a>.</p>

# Specific Sites of an Organ/Space SSI

## Table 4

Code	Site	Code	Site
BONE	Osteomyelitis	LUNG	Other infections of the respiratory tract
BRST	Breast abscess or mastitis	MED	Mediastinitis
CARD	Myocarditis or pericarditis	MEN	Meningitis or ventriculitis
DISC	Disc space	ORAL	Oral cavity (mouth, tongue, or gums)
EAR	Ear, mastoid	OREP	Other infections of the male or female reproductive tract
EMET	Endometritis	OUTI	Other infections of the urinary tract
ENDO	Endocarditis	PJI	Periprosthetic Joint Infection
EYE	Eye, other than conjunctivitis	SA	Spinal abscess without meningitis
GIT	GI tract	SINU	Sinusitis
HEP	Hepatitis	UR	Upper respiratory tract
IAB	Intraabdominal, not specified	VASC	Arterial or venous infection
IC	Intracranial, brain abscess or dura	VCUF	Vaginal cuff
JNT	Joint or bursa		

# Specific Organ Space

## CDC/NHSN Surveillance Definitions for Specific Types of Infections

### INTRODUCTION

This chapter contains the CDC/NHSN surveillance definitions and criteria for all specific types of infections. Comments and reporting instructions that follow the site-specific criteria provide further explanation and are integral to the correct application of the criteria. This chapter also provides further required criteria for the specific infection types that constitute organ/space surgical site infections (SSI) (e.g., mediastinitis [MED]) that may follow a coronary artery bypass graft, intra-abdominal abscess [IAB] after colon surgery).

Additionally, it is necessary to refer to the criteria in this chapter when determining whether a positive blood culture represents a primary bloodstream infection (BSI) or is secondary to a different type of HAI (see [Appendix 1](#) Secondary Bloodstream Infection (BSI) Guide). A BSI that is identified as secondary to another site of HAI must meet one of the criteria of HAI detailed in this chapter. Secondary BSIs are not reported as separate events in NHSN, nor can they be associated with the use of a central line.

Also included in this chapter are the criteria for Ventilator-Associated Events (VAEs). It should be noted that Ventilator-Associated Condition (VAC), the first definition within the VAE surveillance definition algorithm and the foundation for the other definitions within the algorithm (TVAC, Possible VAP, Probable VAP) may or may not be infection-related.

### CDC/NHSN SURVEILLANCE DEFINITIONS OF HEALTHCARE-ASSOCIATED INFECTION

#### Present on Admission (POA) Infections

To standardize the classification of an infection as present on admission (POA) or a healthcare-associated infection (HAI), the following objective surveillance criteria have been adopted by NHSN. NOTE: This classification should not be applied to SSI, VAE, or LabID Events.

If all of the elements used to meet a CDC/NHSN site-specific infection criterion are present during the two calendar days before the day of admission, the first day of admission (day 1) and/or the day after admission (day 2) and are documented in the medical record, the infection is considered POA. Infections that are POA should not be reported as HAIs. Acceptable documentation does not include patient-reported signs and/or symptoms (e.g., patient reporting having a fever prior to arrival to the hospital). Instead, symptoms must be documented in the chart by a healthcare professional during the POA time frame (e.g., nursing home documents fever prior to arrival to the hospital). Physician diagnosis can be accepted as evidence of an infection that is POA only when physician diagnosis is an element of the specific infection definition.

Table 2. CDC/NHSN Major and Specific Types of Healthcare-Associated Infections

Type	Page
<b>BJ – Bone and joint infection</b>	9
BONE – Osteomyelitis	9
DISC – Disc space infection	9
JNT – Joint or bursa infection	10
PJT – Prosthetic joint infection	10
<b>BSI – Bloodstream infection</b>	11
LCBI – Laboratory-confirmed bloodstream infection	11
MBI-LCBI – Mucosal barrier injury laboratory-confirmed bloodstream infection	13
<b>CNS – Central nervous system</b>	18
IC – Intracranial infection	18
MEN – Meningitis or ventriculitis	19
SA – Spinal abscess without meningitis	20
<b>CVS – Cardiovascular system infection</b>	20
CARD – Myocarditis or pericarditis	20
ENDO – Endocarditis	21
MED – Mediastinitis	22
VASC – Arterial or venous infection	22
<b>EENT – Eye, ear, nose, throat, or mouth infection</b>	23
CONJ – Conjunctivitis	23
EAR – Ear, mastoid infection	24
EYE – Eye infection, other than conjunctivitis	24
ORAL – Oral cavity infection (mouth, tongue, or gums)	25
SINU – Sinusitis	25
UR – Upper respiratory tract infection, pharyngitis, laryngitis, epiglottitis	25
<b>GI – Gastrointestinal system infection</b>	26
GE – Gastroenteritis	26
GIT – Gastrointestinal (GI) tract infection	26
HEP – Hepatitis	28
IAB – Intraabdominal infection, not specified elsewhere	28
NEC – Necrotizing enterocolitis	29
<b>LRI – Lower respiratory infection, other than pneumonia</b>	29
BRON – Bronchitis, tracheobronchitis, tracheitis, without evidence of pneumonia	29
LUNG – Other infection of the lower respiratory tract	30
<b>PNEU – Pneumonia</b>	31
PNUI – Clinically-defined pneumonia	33
PNUI – Pneumonia with specific laboratory findings	34
PNUI – Pneumonia in immunocompromised patient	36

# NHSN Principal Operative Procedure Category Selection List

Priority	Code	Abdominal Operations
1	LTP	Liver transplant
2	COLO	Colon surgery
3	BILI	Bile duct, liver or pancreatic surgery
4	SB	Small bowel surgery
5	REC	Rectal surgery
6	KTP	Kidney transplant
7	GAST	Gastric surgery
8	AAA	Abdominal aortic aneurysm repair
9	HYST	Abdominal hysterectomy
10	CSEC	Cesarean section
11	XLAP	Laparotomy
12	APPY	Appendix surgery
13	HER	Herniorrhaphy
14	NEPH	Kidney surgery
15	VHYS	Vaginal Hysterectomy
16	SPLE	Spleen surgery
17	CHOL	Gall bladder surgery
18	OVRV	Ovarian surgery
Priority	Code	Thoracic Operations
1	HTP	Heart transplant
2	CBGB	Coronary artery bypass graft with donor incision(s)
3	CBGC	Coronary artery bypass graft, chest incision only
4	CARD	Cardiac surgery
5	THOR	Thoracic surgery
Priority	Code	Neurosurgical (Brain/Spine) Operations
1	VSHN	Ventricular shunt
2	RFUSN	Refusion of spine
3	CRAN	Craniotomy
4	FUSN	Spinal fusion
5	LAM	Laminectomy
Priority	Code	Neck Operations
1	NECK	Neck surgery
2	THYR	Thyroid and or parathyroid surgery

# Reporting Specific Post-operative Infection

- An SSI that meets the NHSN definitions should be reported without regard to post-operative accidents, falls, inappropriate showering or bathing practices, or other occurrences that may or may not be attributable to patients' intentional or unintentional postoperative actions.

# New Periprosthetic Joint Infection (HPRO and KPRO Only)

Joint or bursa infections must meet at least *1* of the following criteria:

1. Two positive periprosthetic (*tissue or fluid*) cultures with *identical organisms*
2. A sinus tract communicating with the joint
3. Having three of the following minor criteria:
  - a. Elevated serum C-reactive protein (CRP; >100 mg/L) *AND* erythrocyte sedimentation rate (ESR; >30 mm/hr).
  - b. Elevated synovial fluid white blood cell (WBC; >10,000 cells/ $\mu$ L) count *OR* ++ (*or greater*) change on leukocyte esterase test strip of synovial fluid.
  - c. Elevated synovial fluid polymorphonuclear neutrophil percentage (PMN% >90%).
  - d. Positive histological analysis of periprosthetic tissue (>5 neutrophils (PMNs) per high power field).
  - e. A single positive periprosthetic (*tissue or fluid*) culture.

New!

# Multiple Tissue Level SSIs

- The type of SSI (superficial incisional, deep incisional, or organ/space) reported should reflect the **deepest tissue layer involved in the infection.**

# Infection Present at Time of Surgery (PATOS)

- Infection present at time of surgery (PATOS) will be a new field on the SSI Event form.
- PATOS denotes that an infection is present at the start of, or during, the index surgical procedure (in other words, it is present preoperatively).
- This will be a new Yes/No field on the SSI Event form.

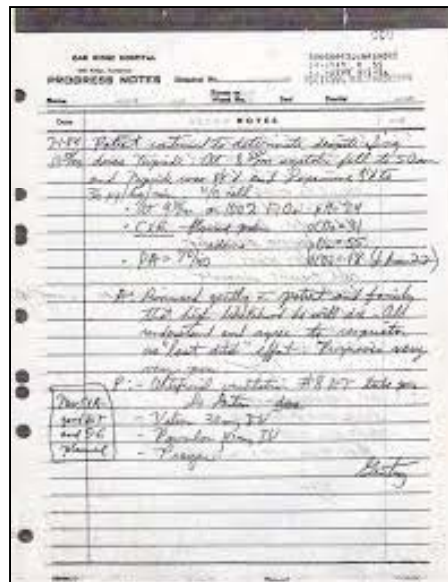

## PATOS (continued)

- PATOS doesn't apply if there is a period of wellness between the time of a preoperative condition and surgery.
- The infection must be noted/documentated preoperatively or found intraoperatively in a preoperative or intraoperative note.
- Only select PATOS = YES if it applies to the depth of SSI that is being attributed to the procedure (e.g., if a patient had evidence of an intraabdominal infection at the time of surgery and then later returns with an organ space SSI the PATOS field would be selected as a YES. If the patient returned with a superficial or deep incisional SSI the PATOS field would be selected as a NO).

## PATOS (continued)

- The patient does not have to meet the NHSN definition of an SSI at the time of the primary procedure but there must be surgeon notation that there is evidence of infection or abscess present at the time of surgery.

2015

## Example #1

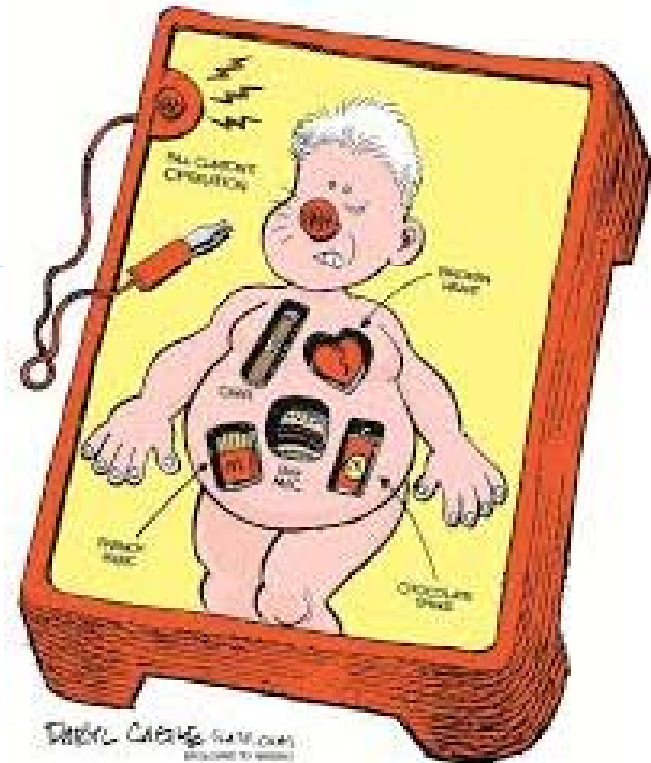

- Patient admitted with an acute abdomen, to OR for XLAP with finding of an abscess due to ruptured appendix, and an APPY is performed. Patient returns 2 weeks later and meets criteria for an organ space IAB SSI.
- The PATOS field would be selected as YES on the SSI event.

2015

## Example #2

- Patient is admitted with a ruptured diverticulum and the surgeon notes that there are multiple abscesses in the intraabdominal space. Patient returns 3 weeks later and meets criteria for a superficial SSI.
- The PATOS field would be selected as NO, since there was no documentation of evidence of infection or abscess of the superficial area at the time of the procedure.

2015

## PATOS SIR

- SSIs reported with PATOS = YES will be excluded from the SSI SIRs beginning with 2016 data and the new baseline.
- These excluded SSIs will be analyzed separately.

## National Healthcare Safety Network (NHSN)

### Tracking Infections in Acute Care Hospitals/Facilities

NHSN is the HAI surveillance gold standard. The system (and its predecessors) started years ago helping a few hundred healthcare facilities; today, more than 11,000 healthcare facilities use NHSN as the cornerstone of their HAI elimination strategies. Specifically, facilities use NHSN to:

- Access NHSN enrollment requirements for CMS Hospital Inpatient Quality Reporting Program.
- Obtain baseline HAI rates.
- Compare rates to CDC's national data.
- Participate in state or national HAI prevention collaboratives.
- Develop and implement HAI elimination strategies.
- Evaluate immediate and long-term results of elimination efforts.
- Refocus efforts as needed, or advance to different areas.
