This chapter provides an overview of the ArubaOS Enterprise MIBs in the following sections:

- [MIBs](#)
- [SNMP](#)
- [Traps](#)

MIBs

A Management Information Base (MIB) is a virtual database that contains information that is used for network management. Each managed device contains MIBs that define the properties of that device. A separate MIB is provided for each defined property, such as the group of physical ports that are assigned to a VLAN or the statistical data of packets that are transferred at a specific rate.

MIB objects, such as a MIB table or a specific element of data in a MIB table, are identified with Object Identifiers (OIDs). The OIDs are designated by text strings and integer sequences. For example, *Aruba* and *1.3.6.1.4.1.14832* both represent the private enterprise node *Aruba*, as shown in [Figure 1 on page 20](#).

Aruba is the parent of the proprietary MIBs that are supported on Aruba Mobility Controllers.

The numerical string lists the nodes of the Aruba enterprise MIB hierarchy, as shown in [Table 3](#).

Table 3 *MIB Node Identification - Aruba enterprise nodes*

Integer	String	Name
1	1	OSI
3	1.3	ORG
6	1.3.6	DOD
1	1.3.6.1	Internet
4	1.3.6.1.4	Private
1	1.3.6.1.4.1	Enterprise
14832	1.3.6.1.4.1.14832	Aruba

[Figure 1](#) illustrates the high-level hierarchy of the MIBs. This document only covers the enterprise MIBs, objects designed to specifically support Aruba devices. Standard MIBs are not covered.

Figure 1 *High-Level MIB Hierarchy*

MIB is one of the elements of Simple Network Management Protocol (SNMP), which is used to manage network devices. To deliver information between devices, every object referred to in an SNMP message must be listed in the MIB. If a component of a device is not described in a MIB, that component cannot be recognized by SNMP—there is no information for SNMP managers and SNMP agents to exchange.

The information provided by a MIB is a file that describes network elements with numerical strings. This information is compiled into readable text by the SNMP manager. For information about reading MIB text files, see [Reading MIB Files on page 28](#).

SNMP

Three significant elements of SNMP are Managers, Agents, and MIBs.

- Managers (software application) are consoles that are used to communicate with and manage devices that support SNMP Agents. Managers collect information by polling Agents. Managers can also be used to send configuration updates or send controlling requests to actively manage a network device.
- Agents (software application) provide information from the network devices to the Managers. Network devices include workstations, routers, microwave radios, and other network components.
- MIBs are used for communication between the Managers and the Agents. The OIDs of the MIBs enable the Managers and Agents to communicate specific data requests and data returns.

- To ensure functionality with SNMP, MIB objects must be defined with the proper *keywords*, as shown in [Table 4](#).

ArubaOS Enterprise MIBs support SNMPv1, SNMPv2, and SNMPv3.

Table 4 *MIB Keywords*

Keyword	Description
Sequence	The sequence of objects of the MIB. This keyword is used mostly with entry MIB objects to list the MIB objects that exchange information.
Syntax	Textual conventions, such as <i>Integer32</i> .
Max-Access	Defines the object accessibility: <i>read-only</i> : can be retrieved but not modified <i>read-write</i> : can be retrieved and modified <i>not-accessible</i> : cannot be retrieved; it is for internal (device) use only <i>accessible-for-notify</i> : can be retrieved when a trap message (notification) is sent
Status	Defines the status of the object: <i>current</i> : up to date <i>deprecated</i> : rolled back to a previous version
Description	A text string that describes the object.

History may be included in some MIB tables—it lists in which ArubaOS release the MIB was updated or otherwise changed.

Traps

An event is a change on a network device, such as a change in value that crosses threshold. Some events are categorized as alarms, other events only provide information. When an event occurs on a network device, SNMP notifications are sent out as traps or information requests.

- Traps are unconfirmed notifications—the receiver does not acknowledge to the sender that the information was received.
- Inform requests are confirmed notifications—the receiver acknowledges to the sender that the information was received.

Following are descriptions of trap types.

- **Discrete Alarm Inputs**
 These traps, also known as digital inputs or contact closures, are used for monitoring equipment failures, intrusion alarms, beacons, and flood and fire detectors.
- **Analog Alarm Inputs**
 Analog alarms measure characteristics that can affect equipment performance—variable levels of voltage or current, temperature, humidity, and pressure.
- **Ping Alarms**
 Ping alarms are used to ping network devices at regular intervals. If a device fails to respond, an alarm (SNMP trap) will be sent.
- **Control Relays**
 Relay outputs enable operating remote site equipment.

- **Terminal Server Function**

The terminal server function enables connection to remote-site serial devices. For example, device connection to serial ports enables telnet access via LAN.

ArubaOS traps are described in the following chapter and sections.

Downloading MIB Files

The most recent ArubaMIB files are available for registered customers at

For assistance to set up an account and access files, please contact customer service. See [Contacting Aruba Networks on page 18](#).

Monitoring WLAN Health

This section lists SNMP MIBs that are frequently used to run health checks on Aruba devices, which can be performed through a MIB browser application. To retrieve information from a MIB, the following information is required:

- SNMP version
- SNMP community name—*public* or *private*
- The IP Address of the Aruba Mobility Controller
- The OID of the MIB

In addition, the MIB files must be available for the application to access and placed in the appropriate disk location. If MIB files need to be acquired, see [Downloading MIB Files](#), above.

It is assumed that the workstation is connected to the Aruba controller and that a MIB browser is available. For most applications, the *root* of the MIB must be included in the OID—the OID begins with a decimal point as shown below.

.1.3.6.1.4.1.14823.2.2.1.1.2.1

MIB Browsers

If using an application that is run through CLI (a *cmd* window), the command would resemble the following:

```
snmpget -v 2c -c <snmp community name> <controller IP address><MIB OID>
```

[Figure 2](#) shows an example of submitting a command to obtain information.

Figure 2 CLI Interface

```
C:\usr\bin>snmpget -v 2c -c public 10.100.101.59 .1.3.6.1.4.1.14823.2.2.1.1.1.1
WLSX-SWITCH-MIB::wlsxHostName = GLOBALS: Aruba200
```

Figure 3 shows how information may be obtained through a graphical user interface (GUI). The user interface and the available features vary by application.

WLAN Health Information

This section lists frequently used MIBs for system health checks. Examples of executing a command via CLI are also provided. Health check information can be acquired through other MIB browsers, as described in [MIB Browsers](#) on page 23

Reading MIB Files

This section describes how to interpret the basic components of a MIB file. To determine the OIDs, viewing the file `snmp.h` may be necessary, which is described in [SNMP File on page 32](#). For additional information about MIB files, see [MIBs on page 19](#). For a listing of SNMP MIB OIDs, see [Chapter 20, “SNMP MIBs Reference” on page 503](#).

MIB files describe a specific component of a network device. The files are numerical strings that are converted to ASCII text by the compiler of the SNMP manager. A word processor or text editor can be used to open the ASCII file. The contents of an example ArubaOS enterprise MIB file, *aruba-cts.my*, are described below.

Opening Line

Following is the opening line, the beginning of the MIB file.

```

Imports

The Imports section lists the objects that are defined in external ASN.1 files and are used in the current MIB file.

```

Inheritance

This section shows the vendor of the MIB and the inheritance, and provides an overall description.

A significant part of inheritance is the OID. The entire OID is not listed for each MIB object—instead, the parent of the object is shown. The tree for the CTS MIB is illustrated in [Figure 4 on page 32](#). The OID can be determined from the parent object as follows.

`wlsxEnterpriseMibModules` is the parent object of the CTS MIB—its OID is 1.3.6.1.4.1.14823.2.2.1.

`wlsxCtsMIB MODULE-IDENTITY` shows `wlsxEnterpriseMibModules 11`, which indicates 11 is appended to the OID of `wlsxEnterpriseMibModules`. The resultant OID is 1.3.6.1.4.1.14823.2.2.1.11.

`wlsxCtsOpGroup OBJECT IDENTIFIER ::= { wlsxCtsMIB 1 }` indicates the OID is 1.3.6.1.4.1.14823.2.2.1.11.1.

`wlsxCtsRequestTable OBJECT-TYPE` shows `wlsxCtsOpGroup 1`, which indicates the OID is 1.3.6.1.4.1.14823.2.2.1.11.1.1.

All MIBs and their related OIDs are listed in the `snmp` file of ArubaOS. For more information, see [SNMP File on page 32](#).

MIB Modules

MIB objects can be placed in logical groups, [Group](#) and [Table](#). One MIB file can consist of multiple groups. A group typically contains at least one table. The table lists the MIB objects that contain the information that is exchanged.

The first object of a table is an [Entry](#). The keyword [SEQUENCE](#) lists the objects of the table that contain device information. Each subsequent object ([Informative MIB Objects](#)) inherits the OID of the Entry, and contains information sorted by keywords: Syntax, Access, Status, Description. For details about keywords, see [MIBs on page 19](#).

The OID of the Entry is wlsxCtsRequestEntry is wlsxCtsRequestTable 1, which represents 1.3.6.1.4.1.14823.2.2.1.11.1.1.1. The OIDs of the subsequent objects of this table are appended increments of the Entry OID. For example, the OID of wlsxCtsIndex is wlsxCtsRequestEntry 1, which represents 1.3.6.1.4.1.14823.2.2.1.11.1.1.1.1.

SNMP File

The `snmp.h` file lists the OIDs of all MIBs. Following are sections from `snmp.h` that show the complete OID of each of the Controller Transport Service (CTS) MIB elements. The list starts from the ancestral parent *iso*.

The SNMP file with all Aruba MIBs is listed in [Chapter 20, “SNMP MIBs Reference” on page 503](#).

All ArubaOS MIBs inherit their OIDs from the Aruba MIB node. The following rows list the MIBs that precede CTS, starting from *iso*.

MIB Limitations

Following are the known limitations and constraints of ArubaOS MIBs.

Table 5 *Limitations and Constraints*

MIB	Module	Limitation
Switch	wlsxSwitchListTable	Information can only be queried from the master switch—only the table of the master switch is populated. If a local switch is queried, an empty table will be returned.
Switch	wlsxSwitchGlobalAPTable	Information can only be queried from the master switch—only the table of the master switch is populated. If a local switch is queried, an empty table will be returned.
Textual Conventions	<i>All objects</i>	Textual conventions objects do not include object identification (OID).

The AP and AM module provides information about access points and air monitors. The access point (AP) is a device or an application that allows connecting a wireless device to a wired local area network (LAN). APs continually poll the network and report information to the controllers. This feature can be used to enhance the security of wireless communication and to extend the range of a wireless user by connecting to a wireless device through a wired LAN.

The Aruba AP can also function as an air monitor (AM), which scans the RF spectrum, and can be used to enhance the performance of the AP.

[Figure 5](#) shows the architecture of the AP AM MIB relative to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.aruba). The AP and AM MIBs are listed in the file *aruba-ap.my*. For information about downloading Aruba MIB files, see [Downloading MIB Files on page 23](#).

This module provides information about the Controller Transport Service. The Controller Transport Service (CTS) is used with the Mobility Management System (MMS) for synchronizing configuration, database, and data sections. The CTS MIBs are used for triggering the data synchronization event with the MMS, such as *config update*.

CTS is not intended to be used with other applications.

Figure 7 shows the relationship of CTS to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.Aruba). The CTS MIBs are listed in the file *aruba-cts.my*. For information about downloading Aruba MIB files, see [Downloading MIB Files on page 23](#).

The Monitor module provides information about network traffic. Monitoring access points can be used to observe network traffic, such as the number of packets transferred at a specific rate, the number of errors per access point, and so on.

[Figure 12](#) shows the architecture of the Monitor MIB relative to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.aruba). The Monitor MIBs are listed in the file `aruba-mon.my`. For information about downloading Aruba MIB files, see [Downloading MIB Files on page 23](#).

The Signal Noise Ratio (SNR) module provides information about signal quality and packets. One value of SNR is the signal quality during a sample period. The signal quality affects the quality of the transmitted packets. The available SNR values include signal strength (total, maximum, minimum). Additional information is the number of packets that were transmitted during the sample time.

Figure 13 shows the architecture of the SNR MIB relative to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.aruba). The SNR MIBs are listed in the file *aruba-snr.my*. For information about downloading Aruba MIB files, see [Downloading MIB Files on page 23](#).

This module defines the Traps that can be generated by the controller. Traps are MIB objects (variables) that transmit information to the SNMP Manager when an event occurs. Traps are included as varbinds (variable bindings) in the trap protocol data unit (PDU). Varbinds are defined in the *Description* section of the tables of the following sections.

Figure 16 shows the architecture of the Traps MIB relative to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.aruba). The Traps are listed in the file *aruba-trap.my*. For information about downloading Aruba MIB files, see [Downloading MIB Files on page 23](#).
