## FISCAL SURVEY OF THE STATES

February 1985, Update

The nation's states ended fiscal year 1984 (FY 1984) with a balance of about \$6.3 billion. Estimates for fiscal 1985 place the ending general fund balance at about \$5.3 billion. These levels are a welcome turnaround from the historically low year-end balance of \$2 billion in fiscal 1983. However, as Figure 1 illustrates, the current improvement still leaves the states with about half of the general fund balances that they held prior to the recent recession. Expectations based on past patterns are that the balance will stabilize as states make adjustments to the improved economy by:

- o repealing the emergency tax increases of the the early 1980s;
- o restoring funding to programs that were severely cut;
- o funding a few carefully selected program initiatives demanded by state voters; and
- o allowing their ending balances to grow to more reasonable levels as buffers against economic uncertainties.

FIGURE 1

### Year-End Balances of the States

National totals, however, mask a wide range in the size and trend of balances in individual states. In 1984, more than one-half of the aggregate general fund ending balance was accounted for by eight states, and in FY 1985, five states are expected to make up a similar proportion of the total. The majority of the states still have balances of three percent or less. Twenty-four states were in this range in FY 1984 and the number will increase to twenty-eight in 1985. Only 16 states are expecting general fund balances of greater than 5 percent in FY 1985. Figure 2 shows the geographic distribution of balances in percentages for FY 1985.

#### Year-End General Fund Balance

The size of unobligated balances as a percent of state general fund expenditures is a significant indicator of the fiscal condition of state governments. In establishing credit ratings for state bonds, financial analysts give close scrutiny to this ratio and other factors indicative of fiscal condition. Traditionally, analysts have accepted a five percent ratio of unobligated balances to expenditures as a reasonable minimum level.

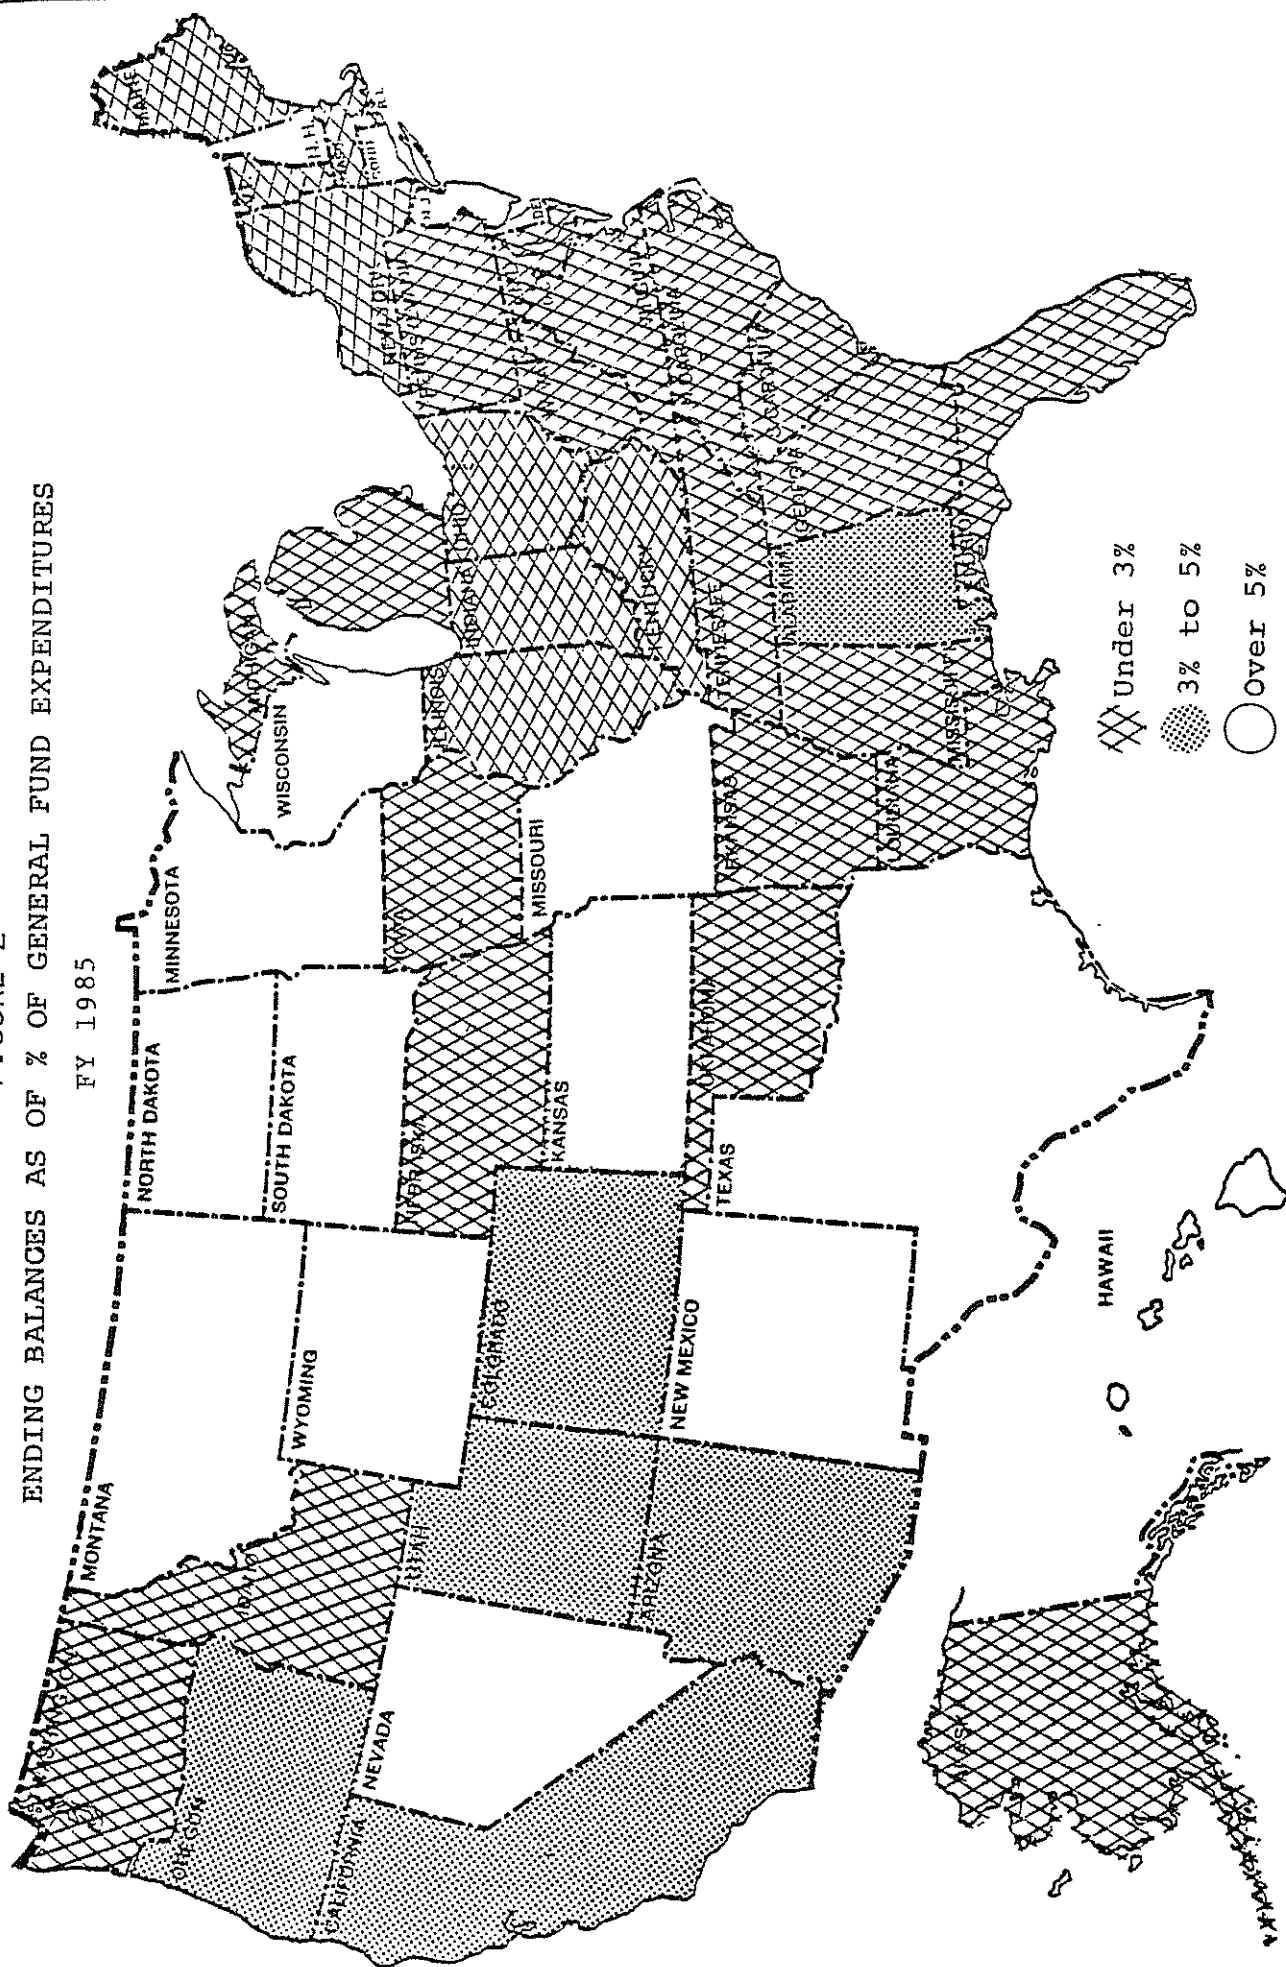

State balances serve a number of other very important purposes such as:

- o hedges against economic uncertainty and the resulting margin of error in revenue and expenditure forecasts;
- o reserves against the unexpected expenses of natural disasters, court-mandated spending, and liability awards; and
- o working funds to meet the cash flow requirements of the state.

#### Annual Expenditure Growth

Compared to the prior year, state general fund expenditures grew by 8.0 percent in FY 1984. They are expected to grow by 10.8 percent in fiscal 1985. When adjusted for inflation, the increases are only 2.8 percent and 5.0 percent respectively. When looking at individual states, it is important to note that some states with biennial budgets (e.g.: Minnesota) allocate all capital spending to one year of the cycle. This results in annual expenditure growth figures which vary considerably from year-to-year, while underlying operating budgets are more stable.

FIGURE 2  
ENDING BALANCES AS OF % OF GENERAL FUND EXPENDITURES  
FY 1985

The modest rate of growth in real state spending comes after a deep recession that forced states to substantially cut budgets in FY 1982 and 1983. Much of the forced savings came from deferral of capital expenditures, across-the-board program cuts, reductions in state agency personnel, and elimination of state personnel merit and cost-of-living increases. In FY 1984 and 1985, Governors and Legislators have restored some of these cuts. They have also recognized widespread citizen demand for increased education funding, spurred by the report of the National Commission on Excellence in Education, A Nation at Risk (April 1983).

Figure 3 clearly shows the sharp reductions in real-dollar state spending that occurred in fiscal 1982 and 1983. In FY 1984, real spending increased, but was still about two percent below the base level of FY 1981. It is not until FY 1985 that real state spending will exceed the 1981 level, and then it will only be about two percent above the level of four years ago. For comparison purposes, Figure 3 also shows the steadily rising level of real Federal spending.

FIGURE 3

### Real Dollar Spending Changes

Base Year: 1981

## Revenue Growth and Tax Changes

Annual revenue growth was strong in FY 1984, showing an increase of 13 percent over 1983. This was due to the combination of a stronger than expected economic recovery and the continuation of tax increases necessitated by the recent deep recession. A much smaller increase of 7.5 percent is expected in FY 1985, due to the moderating economy and the reduction of tax rates in a number of states.

Many states adopted temporary tax measures during the recent recession to help supplement falling revenue collections. For example in 1983, eight states passed major personal income tax increases and 3 states passed major sales tax increases, all of which expired in 1984.<sup>1</sup> These temporary tax changes help explain both the high revenue growth in FY 1984 and the sharp decrease in the rate of growth in FY 1985.

During fiscal 1984 there was no clear pattern to state tax changes. Fifteen states raised revenue by increasing tax rates, broadening the tax base, making temporary taxes permanent, or extending a temporary tax increase. Another 15 states opted to decrease taxes by reducing rates, narrowing the tax base, distributing a tax rebate, accelerating scheduled tax decreases, or allowing a scheduled tax decrease to expire.<sup>2</sup> According to the Fall 1984 Fiscal Survey of the National Conference of State Legislatures, these tax actions resulted in raising tax revenue by \$2.8 billion in some states and lowering tax revenue by \$1.9 billion in other states, for an aggregate net gain of less than one billion dollars.

At the time of publication, 14 states are proposing tax decreases for fiscal 1986, while 16 states may raise taxes. If all of these proposals were to be adopted, the decreases would lower revenues by approximately \$1.9 billion, while the tax increases would raise them by \$0.8 billion. Thus, the aggregate effect of the current proposals would be to lower revenues by \$1.1 billion, or about one-half of one percent, in comparison to simply leaving existing tax and revenue laws in place.

## Regional Differences in Fiscal Outlook

Different regions in the country are experiencing different economic and budget pressures and not all states are sharing equally in the recovery. Many energy-producing states, such as Louisiana and Oklahoma, are now experiencing significant declines in severance tax revenue due to falling prices for crude oil. Some mineral industries, such as coal, copper and molybdenum, have not yet rebounded from the recession, causing

localized pockets of high unemployment within producing states. The Northwest is also experiencing a slower recovery because of its reliance on lumber and related industries. Finally, farm states, such as Iowa and Kansas, continue to experience severe economic stress because of depressed farm prices and high interest rates.

The strongest recovery is apparently in the Great Lakes and most Mid-Atlantic states where the manufacturing sector was hard hit by the recession, but is now showing a strong recovery. California's economy is also faring well, based on strong growth in high-tech industries.

In summary, the recession and recovery have had an uneven effect across the country. The industrial states were the first to feel the recession and the first to enjoy the recovery. Energy and mineral-based states were the last to experience the downturn and may be the last to recover.

#### Rainy Day Funds

Currently, 24 states have budget stabilization or reserve funds, sometimes known as "rainy day" funds. Primarily as a result of experiences of the last recession, at least ten of these states adopted rainy day funds during the last three years. Rainy day funds are designed to set aside revenue while good economic conditions prevail and then draw-down these reserves during poor economic times. Reserve funds can help contribute to a state's countercyclical budget policy by smoothing revenue and expenditure flows during economic cycles. Rather than being forced to immediately cut budgets and raise taxes during recessions, states with such funds can supplement their revenues by transferring reserves to the General Fund. Wall Street bond analysts now take rainy day funds into account when assessing a state's creditworthiness.

In FY 1984, eleven states had \$1 billion set-aside in separate reserve funds, which are not included in general fund balances. This was equal to about 3.8 percent of general fund spending in those eleven states, or about 0.6 percent of spending for all states. It is projected that in FY 1985, sixteen states will have accumulated \$1.6 billion in their separate reserve funds, equalling 3.8 percent of their own spending and about 0.9 percent of general fund spending for all states.

It is important to note that eight other states have not created separate reserve funds, but instead have mandated that a specified general fund ending balance will be designated and serve as a rainy day fund.

Generally, both separate and "designated" funds serve a different function than do normal general fund ending balances. General fund balances are primarily used as a cushion against minor inaccuracies in revenue and expenditure forecasting, or are used to cover unanticipated expenditures. Rainy day funds are designed to deal with major changes in economic conditions and the uncertain timing of economic cycles.

#### National Debate on State Surplus Levels

Recently, the press and some federal officials have circulated accounts and estimates of a developing, sizable budget surplus at the state and local level. Some of these overly optimistic views of the condition of the state and local sector arise from misuse of the National Income and Product Accounts (NIPA). Others arise from an unrealistic attempt to project future levels of the NIPA.

National Income and Product Accounts measure gross receipt and expenditure levels for large sectors of the economy, but do not measure their fiscal conditions. Several specific problems exist in the state and local sector NIPA account. First, capital spending is included in outlays while the borrowing that finances a sizable portion of such spending is not included in receipts. Thus a decrease in the proportion of bond supported capital spending compared to that supported from current revenues will result in an apparent improvement in the balances reported by the NIPA. Second, the NIPA do not provide any breakdown among states nor between state and local levels. This masks significant differences that exist within the sector.

Furthermore, the accounts do not reflect important aspects of state and local finance structure. General Operating Fund data is lumped together with thousands of special funds which are limited to supporting narrowly defined programs and are often generated by earmarked revenues. For example, the existence of a surplus in a state fish and game fund has no relevance in a discussion of the state's ability to support broad-based services.

To complicate matters, the one significant breakdown in the state and local sector -- between "social insurance" and "other funds" -- is too often ignored in fiscal discussions. Social insurance funds are composed almost entirely of pension funds that cannot legally be used to support other government programs.

The national income and product accounts are valuable in formulating national macroeconomic fiscal policy, but are inappropriate as a measure of the fiscal health of state and local governments. In fact, the economist responsible for these accounts has consistently cautioned against using them to ascertain the sector's fiscal health.

### Background and Methodology

The Fiscal Survey of the States series is published by the National Association of State Budget Officers (NASBO) and the National Governors' Association (NGA). The series was started in 1977, and surveys are conducted and published annually, or when appropriate, semiannually. The Survey presents aggregate and individual data on the states general fund receipts, expenditure, and balances. While not the totality of state spending, these funds are used to finance most broad-based state services, and are the most important element in determining the fiscal health of the states.

The field survey on which this report was based was taken by the National Association of State Budget Officers in late calendar 1984. The questionnaires were completed by state budget officers.

Fiscal 1984 closed for 46 states on June 30, 1984. New York's fiscal year ended on March 31, 1984; Texas' on August 31, 1984; Michigan's and Alabama's on September 30, 1984. Thus, fiscal 1984 numbers are actuals, but with adjustments possible as a result of audits. Fiscal 1985 was only partially complete when the survey was taken, so the data represents projections for the entire year. Legislative amendment to FY 1985 budgets also remains possible, and could result in changes to expenditures and thus ending balances.

The structure of the survey presumes budgeting identities as follows:

- (1) Beginning Balance + Revenue + Adjustments = Resources
- (2) Resources - Expenditures - Transfers = Ending Balance
- (3) Ending Balance, Year 1 = Beginning Balance, Year 2

Exceptions to this identity result from rounding and from the practice in a few states of making adjustments between the ending balance in one year and the beginning balance in the next. These exceptions have only a minor impact on the overall results of the survey.

Reporting concepts within this structure vary from state to state, as do definitions of what activities are included in the general fund. Thus, the results of the fiscal survey are not strictly appropriate for comparisons among states. They are more appropriate for comparisons over time in the same state.

## NOTES

1. States with temporary personal income tax increases were: Illinois, Michigan, Minnesota, Oregon, Pennsylvania, Wisconsin, Colorado, and South Carolina. States with temporary sales tax increases were: Colorado, Idaho, and Nebraska. Utah, Arizona, and Vermont had temporary increases that were either made permanent or extended past the original 1984 expiration date.
2. Based on information from "State Budget Actions in 1984", National Conference of State Legislatures, Denver, Colorado, September 1984; and on Significant Features of Fiscal Federalism, 1984 Edition, Advisory Commission on Intergovernmental Relations, Washington, D.C., forthcoming.

FOOTNOTES FOR FY 1983 GENERAL FUND DETAIL

- a Transfer to a budget reserve fund.
- b AK - Includes \$400 transfer to Permanent Fund.
- c LA - Set-aside in special reserve fund.
- d PA - Governor and legislature agreed on plan to fund this deficit in the next fiscal year.
- e TX - Transfer of dedicated revenues to other funds.
- f TX - Transfer to Foundation School Program.
- g DC - Cumulative balances include "pre-home rule deficits." Other figures are strictly annual.  
Transfers include retirement of \$17.0 of the cumulative debt and an adjustment to GAAP.
