Technical Committee:
OASIS Lexicographic Infrastructure Data Model and API (LEXIDMA) TC

Chair:
Tomaž Erjavec (tomaz.erdavec@ijs.si), Jozef Stefan Institute

Editors:
David Filip (david.filip@adaptcentre.ie), Trinity College Dublin (ADAPT)
Simon Krek (simon.krek@ijs.si), Jozef Stefan Institute

Additional artifacts:
NONE AT THE MOMENT

Related Work:
This specification is related to:

• No related specifications.

Declared namespaces:
This specification declares one or more namespaces. Namespace isn't considered an XML specific feature in this serialization independent specification.

The core namespace

• http://docs.oasis-open.org/lexidma/ns/dmlex-1.0

Module namespaces:

• TBD
Key words:
The key words MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL in this document are to be interpreted as described in BCP 14 [RFC2119] and [RFC8174] if, and only if, they appear in all capitals, as shown here.

Abstract:
This document defines the 1st version of a data model in support of the high priority technical goals described in the LEXIDMA TC's charter, including:

- Serialization independent Data Model for Lexicography (DMLex)
- XML serialization of DMLex
- JSON serialization of DMLex
- RDF serialization of DMLex
- Informative Ontolex-Lemon mapping
- Informative TEI Lex-0 mapping

Status:
This document was last revised or approved by the LEXIDMA TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=lexidma#technical.

TC members should send comments on this document to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC's web page at https://www.oasis-open.org/committees/lexidma/.

This specification is provided under the Non-Assertion Mode of the OASIS IPR Policy, the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (https://www.oasis-open.org/committees/lexidma/ipr.php).

Note that any machine-readable content (Computer Language Definitions) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

Citation format:
When referencing this specification the following citation format should be used:

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the “OASIS IPR Policy”). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS’ procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The name "OASIS" is a trademark of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see https://www.oasis-open.org/policies-guidelines/trademark for above guidance.

1 Introduction

Data Model for Lexicography (DMLex) is a serialization independent Object Model designed by a group of lexicographers, lexicographic software providers, and researchers. It is intended to provide a simple, modular, and easy to adopt data model for use by all lexicographic industry actors across companies and academia as well as geographic locations. Adoption of this data model will facilitate exchange of lexicographic and linguistic corpus data globally and enable effective interchange with adjacent industries such as language services, terminology management, and technical writing. Semantic interoperability of lexicographic data will help lexicographers to surpass linguistically and geographically demarcated approaches and create a truly global market for lexicographic data across and among languages and locales.

All text is normative unless otherwise labeled. The following common methods are used for labeling portions of this specification as informative and hence non-normative:

Appendices and sections marked as "(Informative)" or "Non-Normative" in title,
Notes (sections with the "Note" title),
Warnings (sections with the "Warning" title),
Examples (mainly example code listings, tree diagrams, but also any inline examples or illustrative exemplary lists in otherwise normative text),
Schema and other validation artifacts listings (the corresponding artifacts are normative, not their listings).

1.1 Glossary

1.1.1 Definitions

Agent
any application or tool that generates (creates), reads, edits, writes, processes, stores, renders or otherwise handles documents, messages, or any other instantiations of the DMLex. Agent is the most general application conformance target that subsumes all other specialized user agents disregarding whether they are defined in this specification or not.

Enrich, Enriching
the process of associating metadata and resources with DMLex based lexicographic data.

Enricher, Enricher Agent
any Agent that performs the Enriching process.

Modify, Modification
the process of changing core and module DMLex based structural and inline objects that were previously created by other Writers

Processing Requirements

• LIOM objects MAY be Modified and Enriched at the same time.

Modifier, Modifier Agent
an Agent that performs the Modification process.

Writer, Writer Agent
an Agent that creates, generates, or otherwise writes a DMLex based document for whatever purpose, including but not limited to Creator, Modifier, and Enricher Agents.

Note

DMLex intends to define lossless interchange between and among different pipelines that can be based on arbitrary DMLex conformant specifications (public) or even private infor-
mally DMLex based formats (that could evolve into DMLex conformant public specifications over time). Details of interchange using a given serialization are to be found in this specifications normative and informative appendices on various serializations and mappings.

1.1.2 Key concepts

DMLex Core
The core of DMLex 1.0 consists of the minimum set of data objects required to (a) create a DMLex Instance that contains interoperable lexicographic data ...[ELABORATE]

The namespace that corresponds to the core subset of DMLex is http://docs.oasis-open.org/lexidma/ns/dmlex-1.0.

DMLex-defined (elements and attributes)
The following is the list of allowed schema URI prefixes for DMLex-defined elements and attributes:
http://docs.oasis-open.org/lexidma/ns/

Elements and attributes from other namespaces are not DMLex-defined.

DMLex Conformant Specification
A publicly available specification that normatively defines a serialization (document, fragment or message payload format) that conforms to the DMLex defined in this specification.

Currently known conformant serializations and mappings are defined in appendices to this standard: [olinks to appendices, including their normative status]

DMLex Instance
A document, fragment or message payload that is a valid instance of any DMLex Conformant Specification.

Note
Documents, fragments or message payloads cannot conform directly to DMLex, as DMLex itself doesn't define serializations and an ad hoc format cannot be reliably checked against the complex requirements of the DMLex. Currently known LIOM instances include: [Could define and register media types based on some of the appendices].

DMLex Module
A module is an OPTIONAL set of data and metadata categories that were designed to store information about a process applied to a DMLex Instance and the data incorporated into a DMLex Instance as result of that process.

Each official module defined for DMLex Version 1.0 has its data categories and structure defined within this specification and corresponds to at least one dedicated namespace, see Normatively Used Namespaces.
# 2 Conformance

1. **DMLex Instances Conformance**
   a. Conformant DMLex Instances MUST be well formed and valid instances according to one of DMLex Serialization Specifications.
   b. Another Instance conformance clause.
   c. ...
   d. DMLex Instances MAY contain custom extensions, as defined in the Extension Mechanisms section. Extensions MUST be serialized in a way conformant with the pertaining DMLex Serialization Specifications.

2. **Application Conformance**
   a. DMLex Writers MUST create conformant DMLex Instances to be considered DMLex compliant.
   b. Agents processing conformant DMLex Instances that contain custom extensions are not REQUIRED to understand and process non-DMLex objects or attributes. However, conformant applications SHOULD preserve existing custom extensions when processing conformant DMLex Instances, provided that the objects that contain custom extensions are not removed according to DMLex Processing Requirements or the extension's own processing requirements.
   c. All Agents MUST comply with Processing Requirements for otherwise unspecified Agents or without a specifically set target Agent.
   d. Specialized Agents defined in this specification - this is Writer, Modifier, and Enricher Agents - MUST comply with the Processing Requirements targeting their specifically defined type of Agent on top of Processing Requirements targeting all Agents as per point c. above.
   e. DMLex is an object model explicitly designed for exchanging data among various Agents. Thus, a conformant DMLex application MUST be able to accept DMLex Instances Created, Modified, or Enriched by a different application, provided that:
      i. The processed files are conformant DMLex Instances according to the same DMLex Serialization Specification,
      ii. in a state compliant with all relevant Processing Requirements.

3. **Backwards Compatibility**
   a. N/A.

**Note**

DMLex Instances cannot be conformant to this specification w/o being conformant to a specific serialization.
3 The Core Specification

The DMLex Core is for monolingual lexical resources, where headwords, definitions, examples etc. are all in one and the same language.

3.1 LexicographicResource object type

A data set which can be viewed and used by humans as a dictionary and - simultaneously - ingested, processed and understood by software agents as a machine-readable database.

**Warning**

The correct name of this data type in DMLex is lexicographic resource, not lexical.

Properties:

- **language** (optional, IETF language code)
  - The language of headwords, definitions, examples.

  **Note**

  DMLex is based on the assumption that all headwords in a single lexicographic resource are in the same language, and that definitions and examples, if any occur in the resource, are in that language too. The `language` property informs potential users of the resource which language that is.

- **transcriptionScheme** (optional, IETF language code, eg. en-fonipa for English IPA)
  - The scheme (e.g. IPA) in which the transcription property of `Pronunciation` objects is given.

  **Note**

  DMLex is based on the assumption that, if you do use any pronunciation transcriptions in your (monolingual) lexicographic resource, they all follow the same scheme. The `transcriptionScheme` tells potential users of the lexicographic resource which scheme that is.

Children:

- **Entry** (one or more)

Example 1. Example of a lexicographic resource

```xml
LexicographicResource: language="en"
  Entry: headword="aardvark"
    Sense: ...
    Sense: ...
  Entry: headword="abacus"
    Sense: ...
    Sense: ...
  Entry: headword="abandon"
    Sense: ...
    Sense: ...
```

3.2 Entry object type

A part of a lexicographic resource which contains information related to exactly one headword.
Child of:
- LexicographicResource

Properties:
- headword (non-empty string)
  - The headword can be a single word, a multi-word expression, or any expression in the source language which is being described by the entry in the lexicographic resource.
- homographNumber (number, optional)

**Note**

Entries do not have an explicit listing order. An application can imply a listing order from a combination of the headword and the homograph number.

Children:
- PartOfSpeech (zero or more)
- Label (zero or more)
- Pronunciation (zero or more)
- InflectedForm (zero or more)
- Sense (zero or more)

Example 2. Example of a lexicographic entry

```
Entry: headword="bank", homographNumber=1
  PartOfSpeech: ...
  Pronunciation: ...
  Sense: ...
  Sense: ...
```

### 3.3 Sense object type

A part of an entry which groups together information relating to one of the (possibly multiple) meanings (or meaning potentials) of the entry’s headword.

**Note**

An **entry** is a container for formal properties of the headword such as orthography, morphology, syntax and pronunciation. A **sense** is a container for statements about the headword’s semantics.

Child of:
- Entry

Properties:
- listingOrder
  - Can be implicit from the serialization.
- indicator (optional, non-empty string)
  - A short statement that indicates the meaning of a sense and permits its differentiation from other senses in the entry.

**Note**

Indicators are sometimes used in dictionaries as "mini-definitions" instead of or in addition to regular definitions. They are short, one-word or two-word paraphrases of the sense. Their purpose is to allow the (human) user to find the desired sense quickly.
- **definition** (optional, non-empty string)
  - A long statement that describes and/or explains the meaning of a sense.

**Note**

In DMLex, the term definition encompasses not only formal science definitions, but also less formal explanations.

**Children:**
- **Label** (zero or more)
- **Example** (zero or more)

**Example 3. Example of an entry with two senses, each having both an indicator and a definition**

```
Entry: headword="bank"
  Sense: indicator="financial institution", definition = "an institution which..."
    Example: ...
  Sense: indicator="riverside", definition = "an earthen mound which..."
    Example: ...
```

### 3.4 **PartOfSpeech** object type

Any of the word classes to which a lexical item may be assigned, e.g. noun, verb, adjective, etc.

**Child of:**
- Entry

**Properties:**
- **value** (non-empty string)
  - Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.
- **listingOrder**
  - Can be implicit from the serialization.

**Note**

If you want to model other grammatical properties of the headword besides part of speech, such as gender (of nouns) or aspect (of verbs), the recommended way to do that in DMLex is to conflate them to the part-of-speech label, for example "masculine noun" and "feminine noun", or "perfective verb" and "imperfective verb".

**Example 4. Example of a part of speech object**

```
Entry: headword="aardvark"
  PartOfSpeech: value="noun"
```

### 3.5 **Label** object type

An indication of some restriction on the use of the lexical item such time (old-fashioned, neologism), region (dialect), register (formal, colloquial), domain (medicine, politics) or grammar (singular-only).

**Child of:**
- Entry
• Sense
• Pronunciation
• InflectedForm

Properties:

• value (non-empty string)
  • Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.
• listingOrder
  • Can be implicit from the serialization.

Example 5. Example of a label object

Entry: headword="bitch"
  Sense: definition="a female dog"
  Sense: definition="a woman who is difficult to get along with"
  Label: value="slang"

3.6 Pronunciation object type

Information about the pronunciation of its parent.

Child of:

• Entry
• InflectedForm

Properties:

• At least one of:
  • transcription (non-empty string)

Note

The scheme of the transcription (e.g. IPA) can be communicated to users of the lexicographic resource through the transcriptionScheme property of the LexicographicResource object.

• recording (string: name or URL of a sound file)
• listingOrder
  • Can be implicit from the serialization.

Children:

• Label (zero or more)

Example 6. Example of pronunciation given as transcription

Entry: headword="aardvark"
  Pronunciation: transcription="a:rdva:rk"

Example 7. Example of pronunciation given as a sound file

Entry: headword="aardvark"
  Pronunciation: recording="aardvark.mp3"
Example 8. Example of pronunciation given both ways

Entry: headword="aardvark"
  Pronunciation: transcription="a:rdva:rk", recording="aardvark.mp3"

3.7 InflectedForm object type

An inflected headword is a form of the inflectional paradigm of its parent.

Child of:
  • Entry

Properties:
  • caption (non-empty string) e.g. 'plural'
    • Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.
  • value (non-empty string)
  • listingOrder
    • Can be implicit from the serialization.

Children:
  • Usage (zero or more)
  • Pronunciation (zero or more)

Example 9. Example of an entry with two inflected forms

Entry: headword="deirfiúr"
  PartOfSpeech: value="feminine noun"
  InflectedForm: label="genitive singular", value="deirféar"
  InflectedForm: label="plural", value="deirfiúracha"

3.8 Example object type

A sentence or other text extract which illustrates the headword being used in the sense.

Child of:
  • Sense

Properties:
  • text (non-empty string)
  • listingOrder
    • Can be implicit from the serialization.

Example 10. Example of an example

Entry: headword="gripe"
  Sense:
    Example: text="I have a gripe about the service here."
4 Bilingual Module

Extends DMLex Core to support the encoding of bilingual lexicographic resources.

4.1 Extensions to LexicographicResource object type

Additional properties:

- translationLanguage (optional, IETF language code)
- translationTranscriptionScheme (optional, reference to some external authority - which?)
  - The scheme (e.g. IPA) in which the transcription property of TranslationPronunciation objects is given.

4.2 Extensions to Sense object type

Additional children:

- HeadwordTranslation (zero or more)

4.3 HeadwordTranslation object type

The translation equivalent of the headword in one of its senses.

Child of:

- Sense

Properties:

- text (non-empty string)
  - Can be a single word, a multi-word expression, or indeed any expression in the target language.
- listingOrder
  - Can be implicit from the serialization.

Children:

- TranslationPartOfSpeech (zero or more)
- TranslationLabel (zero or more)
- TranslationPronunciation (zero or more)
- TranslationInflectedForm (zero or more)

4.4 TranslationPartOfSpeech object type

Any of the word classes to which the translation may be assigned, e.g. noun, verb, adjective, etc.

Child of:

- HeadwordTranslation

Properties:

- value (non-empty string)
  - Can be constrained by the DMLex Controlled Vocabularies Module.
- listingOrder
  - Can be implicit from the serialization.
4.5 **TranslationLabel object type**

An indication of some restriction on the use of its parent. The restriction can be pragmatic (time, region, register), semantic (domain, semantic type) or formal ('no plural').

Child of:

- HeadwordTranslation
- TranslationPronunciation
- TranslationInflectedForm

Properties:

- **value** (non-empty string)
  - Can be constrained by the DMLex Controlled Vocabularies Module.
  - Its type (e.g. whether register, temporal, geographic etc) can be specified by the by the DMLex Controlled Vocabularies Module.
- **listingOrder**
  - Can be implicit from the serialization.

4.6 **TranslationPronunciation object type**

Information about the pronunciation of its parent.

Child of:

- HeadwordTranslation
- TranslationInflectedForm

Properties (at least one):

- **transcription** (non-empty string)
- **recording** (string: name or URL of a sound file)
- **listingOrder**
  - Can be implicit from the serialization.

Children:

- TranslationLabel (zero or more)

4.7 **TranslationInflectedForm object type**

A form of the inflectional paradigm of its parent.

Child of:

- HeadwordTranslation

Properties:

- **label** (non-empty string) e.g. 'plural'
  - Can be constrained by the DMLex Controlled Vocabularies Module.
- **value** (non-empty string)
- **listingOrder**
  - Can be implicit from the serialization.

Children:

- TranslationLabel (zero or more)
• TranslationPronunciation (zero or more)

### 4.8 HeadwordTranslation object type

The translation equivalent of the headword in one of its senses.

Child of:

• Sense

Properties:

• text (non-empty string)
  • Can be a single word, a multi-word expression, or indeed any expression in the target language.
• listingOrder
  • Can be implicit from the serialization.

Children:

• TranslationPartOfSpeech (zero or more)
• TranslationLabel (zero or more)
• TranslationPronunciation (zero or more)
• TranslationInflectedForm (zero or more)

### 4.9 Extensions to Example object type

Additional children:

• ExampleTranslation (zero or more)

### 4.10 ExampleTranslation object type

The translation of an example.

Child of:

• Example

Properties:

• text (non-empty string)
• listingOrder
  • Can be implicit from the serialization.
5 Internal Linking Module

Used to construct clickable (or otherwise navigable) hyperlinks between objects within the same LexicographicResource.

5.1 EntrySet relation type

Represents an unordered set of two or more entries. Recommended for encoding variants such as masculine and feminine counterparts or spelling variants.

Properties:
- **caption** (non-empty string) eg. "variants"
  - Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.

Participants (all in the same LexicographicResource):
- **entry** (two or more)
  - Reference to an Entry object.

5.2 SenseSet relation type

Represents an unordered set of two or more senses (typically - but not necessarily - belonging to two or more different entries). Recommended for encoding synonyms, near synonyms etc.

Properties:
- **caption** (non-empty string) eg. "synonyms"
  - Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.

Participants (all in the same LexicographicResource):
- **sense** (two or more)
  - Reference to a Sense object.

5.3 SensePair relation type

Represents an undirected pair of two senses (typically - but not necessarily - belonging to two different entries). Recommended for representing pairs of antonyms, opposites, converses and so on.

Properties:
- **caption** (non-empty string) eg. "antonyms"
  - Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.

Participants (all in the same LexicographicResource):
- **sense** (exacly two)
  - Reference to a Sense object.

5.4 SenseTuple relation type

Represents a directed pair of two senses. When the two senses belong to two different entries, then this type is recommended for representing pairs of hyponym/hypernym, broader/narrower, holonym/
meronym. When the two senses belong to the same entry, then this type is recommended for representing the relationship between a sense and a subsense.

Properties:

- caption (non-empty string) eg. "hyponymy"
  - Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.

Participants (all in the same LexicographicResource):

- superordinate (exactly one)
  - Reference to a Sense object.
- subordinate (exactly one)
  - Reference to a Sense object.

5.5 SenseEntryTuple relation type

Represents a directed pair of a sense and an entry, such that the entry does not contain the sense. This type is recommended to be used for situations when the entry is expected to be shown to a human user as a subentry inside the sense of another entry.

Properties:

- caption (non-empty string) eg. "subentry"
  - Can be constrained and mapped to external authorities by the DMLex Controlled Vocabularies Module.

Participants (all in the same LexicographicResource):

- superordinate (exactly one)
  - Reference to a Sense object.
- subordinate (exactly one)
  - Reference to an Entry object.

Example 11. Example: encoding a subentry at subsense level

In this example, when the entry for safe is being shown to a human user, the entry for better safe than sorry is supposed to appear as a subentry at the end of the first sense.

```xml
Entry[#safe]: headword="safe"
   Sense[#safe-sense-1]: indicator="protected from harm"
      Example: value="It isn't safe to park here."
   Sense[#safe-sense-2]: indicator="not likely to cause harm"
      Example: value="Is the ride safe for a small child?"

Entry[#bsts]: headword="better safe than sorry"
   Sense: definition="you should be careful even if it seems unnecessary"

SenseEntryTuple: caption: "subentry" superordinate="#safe-sense-1" subordinate="#bsts"
```
Example 12. Example: encoding a subentry at sense level

In this example, when the entry for bible is being shown to the human user, the entry for the Bible is supposed to be appear there as a subentry, as if it were its first sense.

Entry[#the-bible]: headword="the Bible"
  Sense: "the book considered holy by Christians..."

Entry[bible]: headword="bible"
  Sense[bible-sense-1]: //empty sense, serves as a container for "the Bible"
  Sense[bible-sense-2]: definition="a book considered important..."

SenseEntryTuple: caption="subentry" superordinate="#bible-sense-1" subordinate="#the-bible"
6 External Linking Module

Used to construct links between objects from different lexicographic resources.

6.1 Same relation type

Represents the fact that two or more senses from two or more lexicographic resources are semantically the same.

Participants:
- Sense (two or more, no two of which belong to the same LexicographicResource)

6.2 Subsumption relation type

Represents the fact that one sense from one lexicographic resource is semantically wholly contained inside another sense from another lexicographic resource.

Participants:
- the broader Sense (exactly one)
- the narrower Sense (exactly one)

The two senses must not be within the LexicographicResource.

6.3 Overlap relation type

Represents the fact that two or more senses from two or more lexicographic resources overlap semantically, without either one being semantically wholly contained inside the other.

Participants:
- Sense (two or more, no two of which belong to the same LexicographicResource)
7 Inline Markup Module

7.1 PlaceholderMarker marker type

Marks up a substring inside a headword (or inside a headword translation) which is not part of the expression itself but stands for things that can take its place, or constitutes some kind of meta-notation.

Examples:

- beat [sb.] up
- continue [your] studies

Markup of:

- headword property of Entry
- text property of HeadwordTranslation

7.2 HeadwordMarker marker type

Marks up a substring inside an example (or inside an example translation) which corresponds to the headword (or to a translation of the headword).

Markup of:

- text property of Example
- text property of ExampleTranslation

7.3 CollocateMarker marker type

Marks up a substring inside an example (or inside an example translation) where an important collocate of the headword (or of its translation) occurs.

Markup of:

- text property of Example
- text property of ExampleTranslation

Properties:

- lemma
  - Optional. The lemmatized form of the collocate.

Example 13. Marking up the headword and a collocate inside an example

Example: value="The coroner performed an autopsy."
HeadwordMarker: value=first occurrence of "autopsy"
CollocateMarker: value=first occurrence of "performed" lemma="perform"
8 Controlled Vocabularies Module

This module makes it possible to describe constraints on the values of certain plain-text properties of objects defined in DMLex Core and in DMLex Bilingual Module.

8.1 Extensions to LexicographicResource object type

Additional properties:

- displayLanguage (IETF language code)
  - The language of the display values of the controlled vocabulary items.

Additional children:

- PartOfSpeechValue (zero or more)
- TranslationPartOfSpeechValue (zero or more)
- LabelValue (zero or more)
- TranslationLabelValue (zero or more)
- EntrySetCaption (zero or more)
- SenseSetCaption (zero or more)
- SensePairCaption (zero or more)
- SenseTupleCaption (zero or more)
- SenseEntryTupleCaption (zero or more)
- InflectedFormCaption (zero or more)
- TranslationInflectedFormCaption (zero or more)

8.2 PartOfSpeechValue object type

Represents one of several allowed values for the value property of PartOfSpeech objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

Example 14. Example: restricting part-of-speech values

```xml
LexicographicResource: displayLanguage="en"
  PartOfSpeechValue: value="n", displayValue="noun"
  PartOfSpeechValue: value="v", displayValue="verb"
  PartOfSpeechValue: value="adj", displayValue="adjective"
  Entry: headword="aardvark"
    PartOfSpeech: value="n"
  Entry: headword="speak"
    PartOfSpeech: value="v"
  Entry: headword="small"
    PartOfSpeech: value="adj"
```
Example 15. Example: mapping part-of-speech values to external inventories

PartOfSpeechValue: value="n", displayValue="noun"
  Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#noun"

Example 16. Example: mapping complex part-of-speech values to external inventories

PartOfSpeechValue: value="Nma", displayValue="masculine animate noun"
  Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#noun"
  Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#masculine"
  Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#animate"

8.3 TranslationPartOfSpeechValue object type

Represents one of several allowed values for the value property of TranslationPartOfSpeech objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

8.4 LabelValue object type

Represents one of several allowed values for the value property of Label objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

Example 17. Example: restricting the values of Label objects

LexicographicResource: displayLanguage="en"
  LabelValue: value="sl", displayValue="slang"
  LabelValue: value="vul", displayValue="vulgar"

Example 18. Example: mapping the values of Label objects to external ontologies

LexicographicResource: displayLanguage="en"
  LabelValue: value="sl", displayValue="slang"
    Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#slangRegister"
  LabelValue: value="vul", displayValue="vulgar"
    Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#vulgarRegister"
8.5 TranslationLabelValue object type

Represents one of several allowed values for the value property of TranslationLabel objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

8.6 InflectedFormCaption object type

An InflectedFormCaption represents one of several allowed values for the caption property of InflectedForm objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

Example 19. Example: restricting the captions of inflected forms

LexicographicResource: language="ga", displayLanguage="en"
  PartOfSpeechCaption: value="nf", displayValue="feminine noun"
  InflectedFormCaption: value="gs", displayValue="genitive singular"
  InflectedFormCaption: value="pl", displayValue="plural"
  Entry headword="deirfiúr"
    PartOfSpeech: value="nf"
    InflectedForm: caption="gs", value="deirféar"
    InflectedForm: caption="pl", value="deirfiúracha"

Example 20. Example: mapping the captions of inflected forms to external inventories

InflectedFormCaption: value="gs", displayValue="genitive singular"
  Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#singular"
  Mapping: sameAs= "http://www.lexinfo.net/ontology/3.0/lexinfo#genitiveCase"
InflectedFormCaption: value="pl", displayValue="plural"
  Mapping: sameAs="http://www.lexinfo.net/ontology/3.0/lexinfo#plural"

8.7 TranslationInflectedFormCaption object type

Represents one of several allowed values for the caption property of TranslationInflectedForm objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:
• Mapping (zero or more)

8.8 **EntrySetCaption object type**

Represents one of several allowed values for the *caption* property of *EntrySet* objects.

**Properties:**

• value (non-empty string)
• displayValue (optional)

**Children:**

• Mapping (zero or more)

8.9 **SenseSetCaption object type**

Represents one of several allowed values for the *caption* property of *SenseSet* objects.

**Properties:**

• value (non-empty string)
• displayValue (optional)

**Children:**

• Mapping (zero or more)

8.10 **SensePairCaption object type**

Represents one of several allowed values for the *caption* property of *SensePair* objects.

**Properties:**

• value (non-empty string)
• displayValue (optional)

**Children:**

• Mapping (zero or more)

8.11 **SenseTupleCaption object type**

Represents one of several allowed values for the *caption* property of *SenseTuple* objects.

**Properties:**

• value (non-empty string)
• displayValue (optional)

**Children:**

• Mapping (zero or more)

8.12 **SenseEntryTupleCaption object type**

Represents one of several allowed values for the *caption* property of *SenseEntryTuple* objects.

**Properties:**
• value (non-empty string)
• displayValue (optional)

Children:
• Mapping (zero or more)

### 8.13 Mapping object type

Represents the fact that an item in the controlled vocabulary is equivalent to item provided by an external authority.

Parents:
• PartOfSpeechCaption
• TranslationPartOfSpeechCaption
• LabelCaption
• EntrySetCaption
•SenseSetCaption
• SensePairCaption
• SenseTupleCaption
• TranslationLabelCaption
• InflectedFormCaption
• TranslationInflectedFormCaption

Properties:
• sameAs (URI)
9 Etymology Module

Extends DMLex Core to support the encoding of etymological information in dictionaries.

9.1 Extensions to Entry object type

Additional children:

- **Etymology (zero or more)**

9.2 Etymology object type

An Etymology represents the historical derivation of a word.

Children:

- **EtymDescription (zero or more)**
- **Etymon (zero or more)**
- **MultiEtymon (zero or more)**

9.3 EtymDescription

A plain text form of the etymology, which may contain notes about the etymology. This may be used instead or alongside a structured set of Etymons. The goal of this is to capture the textual description of etymologies for retrodigitised dictionaries.

Child of:

- **Etymology**

Properties:

- **text (non-empty string, required)** the text of the etymological description

9.4 Etymon

Marks up a form that is the etymological origin of the entry or another etymologically related form

Child of:

- **Etymology**
- **MultiEtymon**

Properties:

- **text (non-empty string, required)** the etymological form
- **type (non-empty string, optional)** the type of the etymology. Typical values include derivation, cognate or borrowing. Values should be specified with a EtymonType mapping.
- **language (string, required)** the language of the origin form. Values for languages should be specified with a EtymonLanguage mapping.
- **note (non-empty string, optional)** extra information about the language, for example the precise time (e.g., 16th century) or geographical variants
- **reconstructed (boolean, optional)** indicates that the form is reconstructed and not attested in any corpus
- **gramLabel (string, optional)** a label that indicates a particular grammatical form in the same way as for InflectedForm. Values should be specified with a EtymGramLabel mapping.
- `href` (url, optional) a reference to a source for this etymology in an external resource
- `compOrder` (non-negative integer, required for children of `MultiEtymon` only) if this etymon is part of a multietymon this indicates the order of this etymon. This value may be implicit in some serializations.

Children:
- `EtymTranslation` (zero or more)
- `EtymDate` (zero or more)
- `EtymRelation` (zero or more)

### 9.5 EtymTranslation

Gives a translation of a historical or borrowed form in the language of the dictionary

Child of:
- `Etymon`

Properties:
- `text` (non-empty string, required) the translation of the etymological form in the language of the dictionary

### 9.6 EtymDate

Gives a period of time for which an etymology was valid

Child of:
- `Etymon`

Properties:
- `start` (non-empty string, optional) the start date of when this etymon was used. This can be a year in the Gregorian calendar or an approximate value.
- `end` (non-empty string, optional) the end date of when this etymon was used. This can be a year in the Gregorian calendar or an approximate value.

### 9.7 EtymRelation relation type

Indicates a relation between two etymons

Child of:
- `Etymon`

Properties:
- `caption` (non-empty string, required) indicates the relationship between the etymons. The most typical value is `derivative` indicating that one etymon is a later form of another.
  - Can be constrained and mapped to external authorities using a controlled vocabulary.

Participants (all in the same `LexicographicResource`):
- `etymons` (exactly two)
  - Reference to a `Etymon` object.
9.8 Extensions to Mapping object type

Additional children:

- EtymonGramLabel (zero or more)
- EtymonLanguage (zero or more)
- EtymonType (zero or more)
- EtymRelationCaption (zero or more)

9.9 EtymonGramLabel object type

Represents one of several allowed values for the gramLabel property of Etymon objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

9.10 EtymonLanguage object type

Represents one of several allowed values for the language property of Etymon objects. Note that as etymologies frequently refer to languages that are not covered by ISO standards it is necessary to define codes for all languages used in definitions.

Properties:

- value (non-empty string)
- iso639-1 (non-empty string) the code in the ISO 639-1 standard if it exists
- iso639-3 (non-empty string) the code in the ISO 639-3 standard if it exists
- displayValue (optional)

Children:

- Mapping (zero or more)

9.11 EtymonType object type

Represents one of several allowed values for the type property of Etymon objects.

Properties:

- value (non-empty string)
- displayValue (optional)

Children:

- Mapping (zero or more)

9.12 EtymRelationsCaption object type

Represents one of several allowed values for the caption property of EtymRelation objects.

Properties:

- value (non-empty string)
• displayValue (optional)

Children:

• Mapping (zero or more)
10 DMLex XML serialization

10.1 Introduction

This serialization defines ... ELABORATE

Note

This serialization specification chiefly describes how... ELABORATE

Warning

There is an important difference or similar ELABORATE

However, ... ELABORATE.

Implementers who wish to better access... ELABORATE.

10.2 DMLex namespaces and validation artifacts for its XML serialization

This normative/informative XML serialization of DMLex Version 1.0 makes use of all DMLex namespaces (both core and modules) namespaces: http://docs.oasis-open.org/lexidma/ns/dmlex-1.0, and urn:oasis:names:tc:lexidma:module_01:1.0, and other namespace identifiers as necessary. NAMESPACE SUPPORT IN XML WILL NEED

Validation artifacts [specify type of artifacts if any available at all] for this RDF serialization are available at http://docs.oasis-open.org/lexidma/dmlex/v1.0/wd01/schemas/filename1.filetype1, http://docs.oasis-open.org/lexidma/dmlex/v1.0/wd01/schemas/filename2.filetype1, and http://docs.oasis-open.org/lexidma/dmlex/v1.0/wd01/schemas/filename1.filetype2.

Note

[Potential note content]

10.3 Conformance to the XML serialization of DMLex Version 1.0

Note

Some data categories.... Other data categories .... The below conformance statement is relevant for all data categories expressible in the XML serialization.. There is no interrelation between data categories/ data categories are related as explained in ....

Processing Requirements

• Conformant Processors MUST be able to use and compute at least all the DMLex Core data categories encoded in DMLex XML Instances as per certain conformance clauses ELABORATE

• Subrequirement, ELABORATE.

• Conformant Agents MUST be DMLex Conformant in the sense of DMLex Application Conformance and also ELABORATE.
In particular:

- Conformant Creators MUST be capable of Creating DMlex XML Instances.
- Conformant Enrichers MUST be capable of Enriching DMlex XML Instances with at least.
- Conformant Modifiers MUST be capable of updating at least one data category according to its own Constraints and Processing Requirements as specified in.
- Etc.

10.4 Other XML serialization provisions

Other provisions.

Warning

Note

Another informative pointer.

Processing Requirements

- Writers MUST ELABORATE in DMLex XML Instances.

10.5 XML serialization elements

DMLex XML serialization uses the following elements:

[comma separated list of element olinks]

10.5.1 Diagram

Legend:

1 = one
+ = one or more
? = zero or one
* = zero, one or more

[programlisting code to display the diagram]

10.6 XML serialization attributes

The XML serialization uses the following attributes:

[comma separated list of attribute olinks]
10.7 Example file

Example 21. Example of a couple of DMLex entries RDF serialized

The following example file includes markup related to several DMLex Core and Module data categories.

<!-- example file metadata -->

11 DMLex JSON serialization

11.1 Introduction

This serialization defines ... ELABORATE

   Note

   This serialization specification chiefly describes how... ELABORATE

   Warning

   There is an important difference or similar ELABORATE
   However, ... ELABORATE.
   Implementers who wish to better access... ELABORATE.

11.2 DMLex namespaces and validation artifacts for its JSON serialization

This normative/informative JSON serialization of DMLex Version 1.0 makes use of all DMLex namespaces (both core and modules) namespaces: http://docs.oasis-open.org/lexidma/ns/dmlex-1.0, and urn:oasis:names:tc:lexidma:module_01:1.0, and other namespace identifiers as necessary. NAMESPACE SUPPORT IN JSON WILL NEED

Validation artifacts [specify type of artifacts if any available at all] for this RDF serialization are available at http://docs.oasis-open.org/lexidma/dmlex/v1.0/wd01/schemas/filename1.filetype1, http://docs.oasis-open.org/lexidma/dmlex/v1.0/wd01/schemas/filename2.filetype1, and http://docs.oasis-open.org/lexidma/dmlex/v1.0/wd01/schemas/filename1.filetype2.

   Note

   [Potential note content]

11.3 Conformance to the JSON serialization of DMLex Version 1.0

   Note

   Some data categories.... Other data categories .... The below conformance statement is relevant for all data categories expressible in the JSON serialization.. There is no interrelation between data categories/ data categories are related as explained in ....

Processing Requirements

   • Conformant Processors MUST be able to use and compute at least all the DMLex Core data categories encoded in DMLex JSON Instances as per certain conformance clauses ELABORATE

   • Subrequirement, ELABORATE.

   • Conformant Agents MUST be DMLex Conformant in the sense of DMLex Application Conformance and also ELABORATE.
In particular:

- Conformant Creators MUST be capable of Creating DMlex JSON Instances ELABORATE.
- Conformant Enrichers MUST be capable of Enriching DMlex JSON Instances with at least ELABORATE.
- Conformant Modifiers MUST be capable of updating at least one data category according to its own Constraints and Processing Requirements as specified in ELABORATE.
- Etc. ELABORATE.

### 11.4 Other JSON serialization provisions

Other provisions. ELABORATE

**Warning**

ELABORATE.

**Note**

ELABORATE

Another informative pointer.

*Processing Requirements*

- Writers MUST ELABORATE in DMLex JSON Instances.

### 11.5 JSON serialization objects

DMLex JSON serialization uses the following objects:

[comma separated list of object olinks]

#### 11.5.1 Diagram

Legend:

1 = one  
+ = one or more  
? = zero or one  
* = zero, one or more

```
Appendix A References

This appendix contains the normative and informative references that are used in this document. Normative references are specific (identified by date of publication and/or edition number or Version number) and informative references are either specific or non-specific.

While any hyperlinks included in this appendix were valid at the time of publication, OASIS cannot guarantee their long-term validity.

A.1 Normative references

[BCP 14] is a concatenation of [RFC 2119] and [RFC 8174]

[EXAMPLE_ABBREV] N. Surname, A. Surname, *Exampe Title*, example.org/citetitle Example Citetitle, Month dd, yyyy.

A.2 Informative references (Informative)

Appendix B Machine Readable Validation Artifacts (Informative)

CURRENTLY NO VALIDATION ARTIFACTS FORESEEN FOR THE OM.. JUST FOR SERIALIZATIONS

MAY LIST CONFORMANT ARTIFACTS FOR SPECIFIC SERILIZATIONS AT A LATER STAGE
Appendix C Security and privacy considerations

Note

OASIS strongly recommends that Technical Committees consider issues that might affect safety, security, privacy, and/or data protection in implementations of their work products and document these for implementers and adopters. For some purposes, you may find it required, e.g. if you apply for IANA registration.

While it may not be immediately obvious how your work product might make systems vulnerable to attack, most work products, because they involve communications between systems, message formats, or system settings, open potential channels for exploit. For example, IETF [RFC 3552] lists “eavesdropping, replay, message insertion, deletion, modification, and man-in-the-middle” as well as potential denial of service attacks as threats that must be considered and, if appropriate, addressed in IETF RFCs.

In addition to considering and describing foreseeable risks, this section should include guidance on how implementers and adopters can protect against these risks.

We encourage editors and TC members concerned with this subject to read Guidelines for Writing RFC Text on Security Considerations, IETF [RFC 3552], for more information.
Appendix D Specification Change Tracking (Informative)

This appendix will contain tracked changes after the csprd01 phase will have been reached.
Appendix E Acknowledgements (Informative)

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

- Erjavec, Tomaž - JSI
- Filip, David - TCD, ADAPT Centre
- Jakubíček, Miloš - Lexical Computing
- Kernerman, Ilan - K Dictionaries
- Kosem, Iztok - JSI
- Krek, Simon - JSI
- McCrae, John - National University of Ireland Galway
- Mocha, Milan - JSI
