Technical Committee:
OASIS Lexicographic Infrastructure Data Model and API (LEXIDMA) TC

Chair:
Tomaž Erjavec (tomaz.erjavec@ijs.si), Jozef Stefan Institute

Editors:
Michal M#chura (michmech@mail.muni.cz), Masaryk University
David Filip (david.filip@adaptcentre.ie), Trinity College Dublin (ADAPT)
Simon Krek (simon.krek@ijs.si), Jozef Stefan Institute

Additional artifacts:
NONE AT THE MOMENT

Related Work:
This specification is related to:

• No related specifications.

Declared namespaces:
This specification declares one or more namespaces. Namespace isn't considered an XML specific feature in this serialization independent specification.

The core namespace

• http://docs.oasis-open.org/lexidma/ns/dmlex-1.0

Key words:
The key words MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL in this document are to be interpreted as de-
scribed in BCP 14 [RFC2119] and [RFC8174] if, and only if, they appear in all capitals, as shown here.

Abstract:
This document defines the 1st version of a data model in support of the high-priority technical goals described in the LEXIDMA TC's charter, including:

- A serialization-independent Data Model for Lexicography (DMLex)
- An XML serialization of DMLex
- A JSON serialization of DMLex
- A relational database implementation of DMLex

Status:
This document was last revised or approved by the LEXIDMA TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=lexidma#technical.

TC members should send comments on this document to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC's web page at https://www.oasis-open.org/committees/.

This specification is provided under the Non-Assertion Mode of the OASIS IPR Policy, the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (https://www.oasis-open.org/committees/lexidma/ipr.php).

Note that any machine-readable content (Computer Language Definitions) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

Citation format:
When referencing this specification the following citation format should be used:

1 Introduction

DMLex is a data model for modelling dictionaries (here called lexicographic resources) in computer applications such as dictionary writing systems.

DMLex is a data model, not an encoding format. DMLex is abstract, independent of any markup language or formalism. At the same time, DMLex has been designed to be easily and straightforwardly implementable in XML, JSON, as a relational database, and as a Semantic Web triplestore.

1.1 Modular structure of DMLex

The DMLex specification is divided into a core with several optional modules.

• **DMLex Core** allows you to model the basic entries-and-sense structure if a monolingual lexicographic resource.

• **DMLex Crosslingual Module** extends DMLex Core to model bilingual and multilingual lexicographic resources.

• **DMLex Linking Module** extends DMLex Core and allows you to model various kinds of relations between entries, senses and other objects, including semantic relations such as synonymy and antonymy and presentational relations such as subentries and subsenses, both within a single lexicographic resource and across multiple lexicographic resources.

• **DMLex Inline Markup Module** extends DMLex Core to allow the modelling of inline markup on various objects such as example sentences, including the modelling of collocations and corpus patterns.

• **DMLex Etymology Module** extends DMLex Core to allow the modelling of etymological information in dictionaries.

1.2 Implementing DMLex

DMLex is an abstract data model which can be implemented in many different programming environments and serialization languages. In this document, we give recommended implementations in XML, in JSON and as a relational database.

• The XML and JSON implementations are intended as serializations for data exchange: for encoding lexicographic data while the data is in transit out of one software system into another. Examples of what the two serializations look like with real-world data are given in Section 8, “Examples”.

• The relational database implementation is intended as a representation for lexicographic data while the data is being edited and maintained inside a software system, such as Dictionary Writing System (DWS).
2 Conformance

1. **DMLex Instances Conformance**
   
a. Conformant DMLex Instances MUST be well formed and valid instances according to one of the DMLex Serialization Specifications.

b. Another Instance conformance clause.

c. ...

d. DMLex Instances MAY contain custom extensions, as defined in the Extension Mechanisms section. Extensions MUST be serialized in a way conformant with the pertaining DMLex Serialization Specifications.

2. **Application Conformance**

   a. DMLex Writers MUST create conformant DMLex Instances to be considered DMLex compliant.

   b. Agents processing conformant DMLex Instances that contain custom extensions are not REQUIRED to understand and process non-DMLex objects or attributes. However, conformant applications SHOULD preserve existing custom extensions when processing conformant DMLex Instances, provided that the objects that contain custom extensions are not removed according to DMLex Processing Requirements or the extension's own processing requirements.

   c. All Agents MUST comply with Processing Requirements for otherwise unspecified Agents or without a specifically set target Agent.

   d. Specialized Agents defined in this specification - this is Writer, Modifier, and Enricher Agents - MUST comply with the Processing Requirements targeting their specifically defined type of Agent on top of Processing Requirements targeting all Agents as per point c. above.

   e. DMLex is an object model explicitly designed for exchanging data among various Agents. Thus, a conformant DMLex application MUST be able to accept DMLex Instances Created, Modified, or Enriched by a different application, provided that:

      i. The processed files are conformant DMLex Instances according to the same DMLex Serialization Specification,

      ii. in a state compliant with all relevant Processing Requirements.

3. **Backwards Compatibility**

   a. N/A.

**Note**

DMLex Instances cannot be conformant to this specification w/o being conformant to a specific serialization.
3 DMLex Core

The DMLex Core provides data types for modelling monolingual dictionaries (called lexicographic resources in DMLex) where headwords, definitions and examples are all in one and the same language. DMLex Core gives you the tools you need to model simple dictionary entries which consist of headwords, part-of-speech labels, senses, definitions and so on.

3.1 lexicographicResource

Represents a dictionary. A lexicographic resource is a dataset which can be used, viewed and read by humans as a dictionary and – simultaneously – ingested, processed and understood by software agents as a machine-readable database. Note that the correct name of this data type in DMLex is lexicographic, not lexical, resource.

Contents

- title OPTIONAL (zero or one). Non-empty string. A human-readable title of the lexicographic resource.
- uri OPTIONAL (zero or one). The URI of the lexicographic resource, identifying it on the Web.
- language REQUIRED (exactly one). The IETF language code of the language that this lexicographic resource describes.
- entry OPTIONAL (zero, one or more)
- tag OPTIONAL (zero, one or more)

Comments

- language identifies the language of headwords, definitions and examples in this dictionary. DMLex is based on the assumption that all headwords in a lexicographic resource are in the same language, and that definitions and examples, if any occur in the lexicographic resource, are in that language too. The language child object of lexicographicResource informs potential users of the lexicographic resource which language that is.
- The main role of a lexicographic resource is to contain entries (entry objects). The other object type that can optionally occur inside a lexicographicResource, tag, is for lists of look-up values such as part-of-speech labels.

Example 1. XML

```xml
<lexicographicResource uri="..." language="...">
  <title>...</title>
  <entry.../>
  <tag.../>
</lexicographicResource>
```
Example 2. JSON

```json
{
  "title": "...",
  "language": "...",
  "entries": [...],
  "tags": [...]
}
```

Example 3. RDF

```hex
@prefix dmlex: <http://www.oasis-open.org/to-be-confirmed/dmlex> .

<id> a dmlex:Lexicographic Resource ;
  dmlex:title "..." ;
  dmlex:uri "..." ;
  dmlex:language "..." ;
  dmlex:entry <entry1> , ... ;
  dmlex:tag ... .
```

Example 4. Relational database

![Relational database diagram]

### 3.2 entry

Represents a dictionary entry. An entry contains information about one headword.

**Child of**

- lexicographicResource

**Contents**

- **id** OPTIONAL (zero or one). An unique identifier of the entry. Entries which have identifiers are capable of being involved in relations created with the Linking module.

- **headword** REQUIRED (exactly one). Non-empty string. The entry's headword.

- **homographNumber** OPTIONAL (zero or one). The entry's homograph number, as a guide for humans to distinguish entries with the same headword.
• **partOfSpeech** OPTIONAL (zero, one or more).

• **label** OPTIONAL (zero, one or more).

• **pronunciation** OPTIONAL (zero, one or more).

• **inflectedForm** OPTIONAL (zero, one or more).

• **sense** OPTIONAL (zero, one or more).

**Note**

DMLex Core does not have a concept of "subentry". To model subentries (ie. entries inside entries) in a lexicographic resource, you should use object types from the Linking Module for that.

**Note**

The headword can be a single word, a multi-word expression, or any expression in the source language which is being described by the entry. Entries in DMLex do not have an explicit listing order.

**Note**

An application can imply a listing order from a combination of the headword and the homograph number.

*Example 5. XML*

```xml
<entry id="..." homographNumber="...">
  <headword>...</headword>
  <partOfSpeech.../>
  <label.../>
  <pronunciation.../>
  <inflectedForm.../>
  <sense.../>
</entry>
```

*Example 6. JSON*

```json
{
  "id": "...",
  "headword": "...",
  "homographNumber": "...",
  "partsOfSpeech": [...],
  "labels": [...],
  "pronunciations": [...],
  "inflectedForms": [...],
  "senses": [...]
}
```
Example 7. RDF

```
<id> a dmlex:Entry ;
  dmlex:headword "...";
  dmlex:homographNumber ...;
  dmlex:partOfSpeech ...;
  dmlex:label ...;
  dmlex:pronunciation ...;
  dmlex:inflectedForm ...;
  dmlex:sense ... .
```

Example 8. Relational database

<table>
<thead>
<tr>
<th>Table</th>
<th>PK</th>
<th>FK</th>
<th>Contents</th>

<tr>
<td>inflectedForms</td>
<td>id</td>
<td>entryID</td>
<td></td>
</tr>
</tbody>
</table>

3.3 partOfSpeech

Represents a part-of-speech label.

Child of

- entry

Contents

- **value** REQUIRED (exactly one). Non-empty string. An abbreviation, a code or some other string of text which identifies the part-of-speech label, for example `n` for noun, `v` for verb, `adj` for adjective. The tag object type can be used to explain the meaning of the part-of-speech tags, to constrain which part-of-speech tags are allowed to occur in the lexicographic resource, and to map them onto external inventories and ontologies.

- **listingOrder** REQUIRED (exactly one). Number. The position of this part-of-speech label among other part-of-speech labels of the same entry. This can be implicit from the serialization.
Comments

• If you want to model other grammatical properties of the headword besides part of speech, such as
gender (of nouns) or aspect (of verbs), the way to do that in DMLex is to conflate them to the part-
of-speech label, for example noun-masc and noun-fem, or v-perf and v-imperf.

Example 9. XML

```
<partOfSpeech value="..."/>
```

Example 10. JSON

```
"..."
```

Example 11. RDF

```
<entry> dmlex:partOfSpeech [ 
a dmlex:PartOfSpeech ;
rdf:value "..." ;
dmlex:listingOrder 1 ] .
```

Example 12. Relational database

<table>
<thead>
<tr>
<th>partsOfSpeech</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

### 3.4 inflectedForm

Represents one (of possibly many) inflected forms of the headword. Example: Section 8.2, “How to use inflectedForm”.

Child of

• entry

Contents

• inflectedTag OPTIONAL (zero or one). Non-empty string, an abbreviation, a code or some other
string of text which identifies the inflected form, for example pl for plural, gs for genitive singular,
com for comparative. The tag object type can be used to explain the meaning of the inflection tags,
to constrain which inflection tags are allowed to occur in the lexicographic resource, and to map
them onto external inventories and ontologies.

• text REQUIRED (exactly one). Non-empty string. The text of the inflected form.
• label OPTIONAL (zero, one or more).

• pronunciation OPTIONAL (zero, one or more).

• listingOrder REQUIRED (exactly one). Number. The position of this inflected form among other inflected forms of the same entry. This can be implicit from the serialization.

**Example 13. XML**

```xml
<inflectedForm inflectedTag="...">
  <text>...</text>
  <label.../>
  <pronunciation.../>
</inflectedTag>
```

**Example 14. JSON**

```json
{
  "inflectedTag": "...",
  "text": "...",
  "labels": [...],
  "pronunciations": [...] 
}
```

**Example 15. RDF**

```xml
<entry> dmlex:inflectedForm [
  a dmlex:InflectedForm ;
  dmlex:inflectedTag "..." ;
  dmlex:listingOrder 1 ;
  dmlex:label ... ;
  dmlex:pronunciation ... .
]
```

**Example 16. Relational database**

![Relational database diagram]
The inflectedForm object is intended to model the inflectional morphology of a headword. To model derivational morphology, for example feminine forms of masculine nouns, the recommended way to do that in DMLex is to create separate entries for the two words, and link them using the Linking Module.

3.5 sense

Represents one of possibly many meanings (or meaning potentials) of the headword.

Child of

- entry

Contents

- id OPTIONAL (zero or one). A unique identifier of the sense. Senses which have identifiers are capable of being involved in relations created with the Linking module.

- listingOrder REQUIRED (exactly one). Number. The position of this sense among other senses of the same entry. Can be implicit from the serialization.

- indicator OPTIONAL (zero or one). A short statement, in the same language as the headword, that gives an indication of the meaning of a sense and permits its differentiation from other senses in the entry. Indicators are sometimes used in dictionaries instead of or in addition to definitions.

- label OPTIONAL (zero, one or more).

- definition OPTIONAL (zero, one or more).

- example OPTIONAL (zero, one or more).

Comments

- An entry is a container for formal properties of the headword such as orthography, morphology, syntax and pronunciation. A sense is a container for statements about the headword's semantics. DMLex deliberately makes it impossible to include morphological information at sense level. If you have an entry where each sense has slightly different morphological properties (e.g. a noun has a weak plural in one sense and a strong plural in another) then, in DMLex, you need to treat it as two entries (homographs), and you can use the Linking Module to link the two entries together and to make sure they are always shown together to human users.

Example 17. XML

```
<sense id="...">
  <indicator>...</indicator>
  <label/>  
  <definition.../>  
  <example.../>  
</sense>
```
Example 18. JSON

```json
{
    "id": "...",
    "indicator": "...",
    "labels": [...],
    "definitions": [...],
    "examples": [...]
}
```

Example 19. RDF

```xml
<id> a dmlex:Sense ;
    dmlex:listeningOrder 1 ;
    dmlex:indicator "..." ;
    dmlex:label ... ;
    dmlex:definition ... ;
    dmlex:example ... .
```

Example 20. Relational database

```
<table>
<thead>
<tr>
<th>senses</th>
<th>labels</th>
<th>definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK id</td>
<td>PK id</td>
<td>PK id</td>
</tr>
<tr>
<td>FK entryID</td>
<td>FK senseID</td>
<td>FK senseID</td>
</tr>
<tr>
<td>indicator</td>
<td></td>
<td></td>
</tr>
<tr>
<td>listingOrder</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

3.6 definition

Represents one of possibly several definitions of a sense.

Child of

- sense

Contents

- value REQUIRED (exactly one). Non-empty string. A statement, in the same language as the headword, that describes and/or explains the meaning of a sense. In DMLex, the term definition encompasses not only formal definitions, but also less formal explanations.

- definitionType OPTIONAL (zero or one). If a sense contains multiple definitions, indicates the difference between them, for example that they are intended for different audiences. The tag object type can be used to constrain and/or explain the definition types that occur in the lexicographic resource.
• `listingOrder` REQUIRED (exactly one). Number. The position of this definition among other definitions of the same sense. This can be implicit from the serialization.

**Example 21. XML**

```xml
<definition definitionType="...">...</definition>
```

**Example 22. JSON**

```json
{
    "text": "....",
    "definitionType": "...
}
```

**Example 23. RDF**

```xml
<entry> dmlex:definition [ 
    a dmlex:Definition ;
    rdf:value "...";
    dmlex:definitionType "...";
    dmlex:listingOrder 1 ] .
```

**Example 24. Relational database**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
<td>id</td>
</tr>
<tr>
<td>FK</td>
<td>senseID</td>
</tr>
<tr>
<td></td>
<td>text</td>
</tr>
<tr>
<td></td>
<td>definitionType</td>
</tr>
<tr>
<td></td>
<td>listingOrder</td>
</tr>
</tbody>
</table>

### 3.7 label

Represents a restriction on its parent such as temporal (old-fashioned, neologism), regional (dialect), register (formal, colloquial), domain (medicine, politics) or grammar (singular-only).

**Child of**

- `entry`
- `sense`
- `inflectedForm`
- `pronunciation`
- `example`
Contents

• **value** REQUIRED (exactly one). Non-empty string. An abbreviation, a code or some other string of text which identifies the label, for example *neo* for neologism, *colloq* for colloquial, *polit* for politics. The *tag* object type can be used to explain the meaning of the labels, to constrain which labels are allowed to occur in the lexicographic resource, and to map them onto external inventories and ontologies.

• **listingOrder** REQUIRED (exactly one). Number. The position of this label among other labels of the same entry. This can be implicit from the serialization.

Comments

• A label applies to the object that it is a child of. When the label is a child of *entry*, then it applies to the headword in all its senses. When the label is a child of *sense*, then it applies to the headword in that sense only (not including any subsenses linked to it using the Linking Module). When the label is a child of *inflectedForm*, then it applies only to that inflected form of the headword (in all senses). When the label is a child of *pronunciation*, then it applies only to that pronunciation of the headword (in all senses).

**Example 25. XML**

```xml
<label value="..."/>
```

**Example 26. JSON**

```json
"..."
```

**Example 27. RDF**

```xml
<entry> dmlex:label [ 
  a dmlex:Label ;
  rdf:value "..." ;
  dmlex:listingOrder 1 ] .
```

**Example 28. Relational database**

<table>
<thead>
<tr>
<th>labels</th>
<th></th>
<th></th>

### 3.8 pronunciation

Represents the pronunciation of its parent. Examples: Section 8.3, “Pronunciation given as transcription”, Section 8.4, “Pronunciation given as a sound file”, Section 8.5, “Pronunciation given both ways”.

Child of

- entry
- inflectedForm

Contents

- soundFile OPTIONAL (zero or one). A pointer to a file, such as a filename or a URI, containing a sound recording of the pronunciation
- transcription OPTIONAL (zero, one or more).
- listingOrder REQUIRED (exactly one). Number. The position of this pronunciation object among other pronunciation objects of the same entry. This can be implicit from the serialization.
- label OPTIONAL (zero, one or more).

**Example 29. XML**

```xml
<pronunciation soundFile="...">
  <transcription.../>
  <label.../>
</pronunciation>
```

**Example 30. JSON**

```json
{
  "soundFile": "...",
  "transcriptions": [...],
  "labels": [...] 
}
```

**Example 31. RDF**

```xml
<entry> dmlex:pronunciation [ a dmlex:Pronunciation ;
  dmlex:soundFile <...> ;
  dmlex:transcription ... ;
  dmlex:listingOrder 1 ;
  dmlex:label ... ] .
```

Example 32. Relational database

<table>
<thead>
<tr>
<th>pronunciations</th>
<th>transcriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK id</td>
<td>PK id</td>
</tr>
<tr>
<td>FK entryID</td>
<td>FK pronunciationID</td>

<td>listingOrder</td>
</tr>
<tr>
<td>labels</td>
<td></td>
</tr>
<tr>
<td>PK id</td>
<td>PK id</td>
</tr>
<tr>
<td>FK pronunciationID</td>
<td></td>
</tr>
</tbody>
</table>

3.9 transcription

Represents the transcription of a pronunciation in some notation such as IPA.

Child of
- pronunciation

Contents
- text REQUIRED (exactly one). Non-empty string. The actual transcription.
- scheme OPTIONAL (zero or one). IETF language tag. Identifies the transcription scheme used here. Example: en-fonipa for English IPA. This can be implicit if the lexicographic resource uses only one transcription scheme throughout.
- listingOrder REQUIRED (exactly one). Number. The position of this transcription object among transcriptions of the same pronunciations. This can be implicit from the serialization.

Example 33. XML

```xml
<transcription scheme="...">...</transcription>
```

Example 34. JSON

```json
{
   "text": "...",
   "scheme": "..."
}
```

Example 35. RDF

```xml
<pronunciation> dmlex:transcription [
    a dmlex:Transcription ;
    dmlex:scheme "..." ;
    dmlex:listingOrder 1 ] .
```
Example 36. Relational database

<table>
<thead>
<tr>
<th>transcriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

3.10 example

Represents a sentence or other text fragment which illustrates the headword being used.

Child of

- sense

Contents

- text REQUIRED (exactly one). Non-empty string. The example itself.
- sourceIdentity OPTIONAL (zero or one). An abbreviation, a code or some other string of text which identifies the source. The tag object type can be used to explain the meaning of the source identifiers, to constrain which source identifiers are allowed to occur in the lexicographic resource, and to map them onto external inventories and ontologies.
- sourceElaboration OPTIONAL (zero or one). Non-empty string. A free-form statement about the source of the example. If source is present, then sourceElaboration can be used for information where in the source the example can be found: page number, chapter and so on. If sourceIdentity is absent then sourceElaboration can be used to fully name the source.
- label OPTIONAL (zero, one or more).
- soundFile OPTIONAL (zero or one). A pointer to a file, such as a filename or a URI, containing a sound recording of the example.
- listingOrder REQUIRED (exactly one). Number. The position of this example object among examples of the same sense. This can be implicit from the serialization.

Example 37. XML

```xml
<example sourceIdentity="..." sourceElaboration="..." soundFile="...">
  <text>...</text>
  <label.../>
</example>
```
Example 38. JSON

```json
{
    "text": "...",
    "sourceIdentity": "...",
    "sourceElaboration": "...",
    "labels": [ ... ],
    "soundFile": "..."
}
```

Example 39. RDF

```xml
<entry> dmlex:example [
    a dmlex:Example ;
    rdf:value "..." ;
    dmlex:sourceIdentity "..." ;
    dmlex:sourceElaboration "..." ;
    dmlex:label ... ;
    dmlex:soundFile <...> ;
    dmlex:listingOrder 1 ] .
```

Example 40. Relational database

<table>
<thead>
<tr>
<th>examples</th>
<th>labels</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK id</td>
<td>PK id exampleID</td>
</tr>
<tr>
<td>senseID</td>
<td>...</td>
</tr>
<tr>
<td>text</td>
<td></td>
</tr>
<tr>
<td>sourceIdentity</td>
<td></td>
</tr>
<tr>
<td>sourceElaboration</td>
<td></td>
</tr>
<tr>
<td>soundFile</td>
<td></td>
</tr>
<tr>
<td>listingOrder</td>
<td></td>
</tr>
</tbody>
</table>

3.11 tag

Represents one (of many) possible values for value of `partOfSpeech`, `inflectedTag` of `inflectedForm`, `definitionType` of `definition`, value of `label` or `sourceIdentity` of `example`. Example: Section 8.6, “How to use tag”.

Child of

- lexicographicResource

Contents

- value REQUIRED (exactly one). Non-empty string. An abbreviation, a code or some other string of text.
- description OPTIONAL (zero or one). Non-empty string. A human-readable description of what the tag means.
- **target** OPTIONAL (zero, one or more). Indicates how the value of this tag can be used in this lexicographic resource. One of:
  - **partOfSpeech** The tag value can be used in value of `partOfSpeech`.
  - **inflectedTag** The tag value can be used in `inflectedTag` of `inflectedForm`.
  - **definitionType** The tag value can be used in `definitionType` of `definition`.
  - **label** The tag value can be used in value of `label`.
  - **sourceIdentity** The tag value can be used in `sourceIdentity` of `example`. If omitted, then all.
  - **partOfSpeechConstraint** OPTIONAL (zero, one or more). If present, says that this tag is only intended to be used inside entries that are labelled with this part of speech. This can be used to constrain that, for example, only nouns and adjectives can have plurals but other parts of speech cannot.
  - **sameAs** OPTIONAL (zero, one or more).

**Comments**

- In a lexicographic resource, `tag` objects can used to define controlled vocabularies (inventories of part-of-speech tags, labels etc.) and constrains on where they are expected to be used (e.g. part-of-speech tags are expected to be used as value of `partOfSpeech` objects).

  Enforcing these constraints in an implementation of DMLex, for example as business rules in a dictionary-writing system, is OPTIONAL: an implementation of DMLex is compliant regardless of whether it enforces the constraints defined by `tag` objects or not.

*Example 41. XML*

```xml
<tag value="...">
  <description>...</description>
  <target value="...">
  <partOfSpeechConstraint value="...">
  <sameAs...>
</tag>
```

*Example 42. JSON*

```json
{
  "value": "...",
  "description": "...",
  "targets": ["..."],
  "partOfSpeechConstraints": ["..."],
  "sameAs": [...]
}
```
Example 43. RDF

```xml
<entry> dmlex:tag [ 
  a dmlex:Tag ;
  dmlex:description "..." ;
  dmlex:target "..." ;
  dmlex:partOfSpeechConstraint "..." ;
  dmlex:sameAs ... ] .
</entry>
```

Example 44. Relational database

<table>
<thead>
<tr>
<th>PK</th>
<th>id</th>
</tr>
</thead>
<tbody>
<tr>
<td>FK</td>
<td>lexicographicResourceId</td>
</tr>
<tr>
<td></td>
<td>value</td>
</tr>
<tr>
<td></td>
<td>description</td>
</tr>
<tr>
<td></td>
<td>target</td>
</tr>
<tr>
<td></td>
<td>partOfSpeechConstraints</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PK</th>
<th>id</th>
</tr>
</thead>
<tbody>
<tr>
<td>FK</td>
<td>tagID</td>
</tr>
</tbody>
</table>

The `partOfSpeechConstraints` column is a comma-delimited list of part-of-speech labels.

3.12 `sameAs`

Represents the fact that the parent object is equivalent to an item available from an external authority. Example: Section 8.7, “Mapping tag to external inventories”.

Child of
- `tag`

Contents
- `value` REQUIRED (exactly one). The URI of an item in an external inventory.

Example 45. XML

```xml
<sameAs uri="..."/>
```

Example 46. JSON

```json
"..."
```
Example 47. Relational database

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
<td>id</td>
</tr>
<tr>
<td>FK</td>
<td>tagID</td>
</tr>
<tr>
<td></td>
<td>uri</td>
</tr>
</tbody>
</table>
4 DMLex Crosslingual Module

DMLex's Multilingual Module extends the Core and turns a monolingual lexicographic resource into a bilingual or multilingual one. A bilingual or multilingual lexicographic resource is a lexicographic resource with multiple (two or more) languages: the headwords and the examples are in one language (called the headword language in DMLex) and their translations are in one or more other languages (called the translation languages in DMLex).

4.1 Extensions to lexicographicResource

Extends the lexicographicResource object type from the Core.

Additional contents

- translationLanguage REQUIRED (one or more)

Example 48. XML

```xml
<lexicographicResource ...>
  ...
  <translationLanguage.../>
</lexicographicResource>
```

Example 49. JSON

```json
{
  ..., 
  "translationLanguages": [...]
}
```

4.2 translationLanguage

Represents one of the languages in which translations are given in this lexicographic resource. Examples: Section 8.8, "Defining a bilingual lexicographic resource", Section 8.9, "Defining a multilingual lexicographic resource".

Child of

- lexicographicResource

Contents

- value REQUIRED (exactly one). The IETF language code of the language.

- listingOrder REQUIRED (exactly one). Number. sets the order in which translations of headwords and examples should be shown. It outranks the listing order given in headwordTranslation, headwordExplanation and exampleTranslation objects.
4.3 Extensions to sense

Extends the sense object type from the Core.

Additional contents

- **headwordExplanation** OPTIONAL (zero, one or more)
- **headwordTranslation** OPTIONAL (zero, one or more)

Example 53. XML

```xml
<sense ...>
  ...
  <headwordExplanation.../>
  <headwordTranslation.../>
  ...
</sense>
```

Example 54. JSON

```json
{
  "headwordExplanations": [...],
  "headwordTranslations": [...],
  ...
}
```
4.4 **headwordTranslation**

Represents one of possibly multiple translations of a headword. Examples: Section 8.10, “How to use headwordTranslation in a bilingual lexicographic resource”, Section 8.11, “How to use headwordTranslation in a multilingual lexicographic resource”.

*Child of*

- sense

*Contents*

- **text** REQUIRED (exactly one). Non-empty string.

- **language** OPTIONAL (zero or one) if only one translation language exists in the lexicographic resource, REQUIRED (one or more) otherwise. IETF language tag. Indicates the language of this translation. The translationLanguage datatype can be used to explain the meaning of the language codes that appear here and/or to constrain which language codes are allowed.

- **listingOrder** REQUIRED (exactly one). Number. The position of this translation among other translations of the same sense in the same language. Can be implicit from the serialization.

- **partOfSpeech** OPTIONAL (zero, one or more).

- **label** OPTIONAL (zero, one or more).

- **pronunciation** OPTIONAL (zero, one or more).

- **inflectedForm** OPTIONAL (zero, one or more).

*Example 55. XML*

```xml
<headwordTranslation language="...">
  <text>...</text>
  <partOfSpeech.../>
  <label.../>
  <pronunciation.../>
  <inflectedForm.../>
</headwordTranslation>
```

*Example 56. JSON*

```json
{
  "language": "...",
  "text": "...",
  "partsOfSpeech": [...],
  "labels": [...],
  "pronunciations": [...],
  "inflectedForms": [...]}
```
4.5 headwordExplanation

Represents a statement in the target language which explains (but does not translate) the meaning of the headword. Example: Section 8.12, “How to use headwordExplanation”.

Child of

- `sense`

Contents

- `text` REQUIRED (exactly one). Non-empty string.
- `language` OPTIONAL (zero or one) if only one translation language exists in the lexicographic resource, REQUIRED (one or more) otherwise. IETF language tag. Indicates the language in which this explanation is written. The `translationLanguage` datatype can be used to explain the meaning of the language codes that appear here and/or to constrain which language codes are allowed.

Comments

- It is assumed that there will always be a maximum of one `headwordExplanation` per translation language in each sense. For this reason, `headwordExplanation` does not have a `listingOrder`.

Example 58. XML

```xml
<headwordExplanation language="...">...
</headwordExplanation>
```

Example 59. JSON

```json
{
    "language": "...",
    "text": "...",
}
```
Example 60. Relational database

<table>
<thead>
<tr>
<th>headwordExplanations</th>
<th>PK</th>
<th>id</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>FK</td>
<td>senseID</td>
</tr>
<tr>
<td></td>
<td>FK</td>
<td>language</td>
</tr>
<tr>
<td></td>
<td></td>
<td>text</td>
</tr>
</tbody>
</table>

4.6 Extensions to example

Extends the example object type from the Core.

Additional contents

- exampleTranslation OPTIONAL (zero, one or more)

Example 61. XML

```xml
<example ...>
  ...
  <exampleTranslation.../>
</example>
```

Example 62. JSON

```json
{
  ..., // Example: exampleTranslations
  "exampleTranslations": [...]
}
```

4.7 exampleTranslation

Represents the translation of an example.

Child of

- example

Contents

- text REQUIRED (exactly one). Non-empty string.
- language OPTIONAL (zero or one) if only one translation language exists in the lexicographic resource, REQUIRED (one or more) otherwise. IETF language tag. Indicates the language of this translation. The translationLanguage datatype can be used to explain the meaning of the language codes that appear here and/or to constrain which language codes are allowed.
- soundFile OPTIONAL (zero or one). A pointer to a file, such as a filename or a URL containing a sound recording of the translation.
• listingOrder REQUIRED (exactly one). Number. The position of this translation among other translations of the same example in the same language. Can be implicit from the serialization.

Example 63. XML

```xml
<exampleTranslation language="..." soundFile="...">
    <text>...</text>
    <label.../>
</exampleTranslation>
```

Example 64. JSON

```json
{
    "language": "...",
    "text": "...",
    "labels": [...],
    "soundFile": "..."
}
```

Example 65. Relational database

```plaintext
exampleTranslations
PK   id
FK   exampleID
FK   language
    text
    soundFile
    listingOrder
```

4.8 Extensions to partOfSpeech

Extends the partOfSpeech object type from the Core.

Can additionally be a child of

• headwordTranslation

Example 66. Relational database

```plaintext
partsOfSpeech
PK   id
FK   entryID
FK   headwordTranslationID
    value
    listingOrder
```
4.9 Extensions to label

Extends the label object type from the Core.

Can additionally be a child of

- headwordTranslation

Example 67. Relational database

<table>
<thead>
<tr>
<th>labels</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

4.10 Extensions to pronunciation

Extends the pronunciation object type from the Core.

Can additionally be a child of

- headwordTranslation

Example 68. Relational database

<table>
<thead>
<tr>
<th>pronunciations</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

4.11 Extensions to inflectedForm

Extends the inflectedForm object type from the Core.

Can additionally be a child of

- headwordTranslation
4.12 Extensions to tag

Extends the tag object type from the Core.

Additional contents

- **sideConstraint** OPTIONAL (zero or one). If present, indicates whether this tag is intended to be used on the headword side or on the translation side of the lexicographic resource. One of:
  - **headwordSide** This tag is supposed to be used on the headword side of the lexicographic resource: anywhere except inside a headwordTranslation object.
  - **translationSide** This tag is supposed to be used on the translation side of the lexicographic resource: inside a headwordTranslation object only.

- **translationLanguageConstraint** OPTIONAL (zero, one or more). If present, says that if this tag is being used inside a headwordTranslation object, then it is intended to be used only inside a headwordTranslation object labelled with this language.

Redefinition of partOfSpeechConstraint:

- If present, says that:
  - If this tag is used inside a headwordTranslation, then it is intended to be used only inside a headwordTranslation labelled with this part of speech.
  - If this tag is used outside a headwordTranslation, then it is intended to be used only inside entries that are labelled with this part of speech.

Example 70. XML

```xml
<tag ... sideConstraint="...">
  ...
  <translationLanguageConstraint langCode="..."/>
</tag>
```
Example 71. JSON

```json
{
    ..., 
    "sideConstraint": ". . .",
    "translationLanguageConstraint": ["..."]
}
```

Example 72. Relational database

<table>
<thead>
<tr>
<th>tags</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

The `translationLanguageConstraints` column is a comma-delimited list of language codes.
5 DMLex Linking Module

DMLex’s Linking Module can be used to construct relations between objects which “break out” of the tree-like parent-and-child hierarchy constructed from datatypes from the Core and from other modules. The Linking Module can be used to create relations between senses which are synonyms or antonyms, between entries whose headwords are homonyms or spelling variants, between senses which represent superordinate and subordinate concepts (e.g. hypernyms and hyponyms, holonyms and meronyms), between entries and subentries, between senses and subsenses, and many others.

Each relation is represented in DMLex by an instance of the relation datatype. A relation brings two or more members together. The fact that an object (such as a sense or an entry) is a member of a relation is represented in DMLex by an instance of the member datatype.

The Linking Module can be used to set up relations between objects inside the same lexicographic resource, or between objects residing in different lexicographic resources.

Relations themselves can be members of other relations.

5.1 Extensions to lexicographicResource

Extends the lexicographicResource object type from the Core.

Additional contents

- relation OPTIONAL (zero, one or more)
- relationType OPTIONAL (zero, one or more)

Example 73. XML

```xml
<lexicographicResource ...>
    ...
    <relation.../>
    <relationType.../>
</lexicographicResource>
```

Example 74. JSON

```json
{
    ...
    "relations": [...],
    "relationTypes": [...]
}
```

5.2 relation

Represents the fact that a relation exists between two or more objects.
Child of

- lexicographicResource

Contents

- type REQUIRED (exactly one). Non-empty string. Specifies what type of relation it is, for example a relation between synonyms or a relation between a sense and a subsense. Optionally, relation-Type objects can be used to explain those types and to constrain which types of relations are allowed to exist in the lexicographic resource.

- description OPTIONAL (zero or one). Non-empty string. Is an optional human-readable explanation of this relation.

- member REQUIRED (two or more).

Example 75. XML

```xml
<relation type="...">
  <description>...</description>
  <member.../>
</relation>
```

Example 76. JSON

```json
{
  "type": "...",
  "description": "...",
  "members": [...]
}
```

Example 77. Relational database

<table>
<thead>
<tr>
<th>relations</th>
<th>members</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
<td>id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5.3 member

Represents the fact that an object, such as an entry or a sense, is a member of a relation.

Child of

- relation

Contents

- idref REQUIRED (exactly one). The ID of an object, such as an entry or a sense.

- role OPTIONAL (zero or one). Non-empty string. An indication of the role the member has in this relation: whether it is the hypernym or the hyponym (in a hyperonymy/hyponymy relation), or whether it is one of the synonyms (in a synonymy relation), and so on. You can use memberRole objects to explain those roles and to constrain which relations are allowed to contain which roles, what their
object types are allowed to be (eg. entries or senses) and how many members with this role each relation is allowed to have.

- **listingOrder REQUIRED** (exactly one). Number. The position of this member among other members of the same relation. It should be respected when showing members of the relation to human users. This can be implicit from the serialization.

- **reverseListingOrder REQUIRED** (exactly one). Number. The position of this relation among other relations this member is involved in. It should be respected when showing the relations of this member to a human user. This can be implicit from the serialization.

Example 78. XML

```
<member idref="..." role="..." reverseListingOrder="..."/>
```

Example 79. JSON

```
{
    "idref": "...",
    "role": "...",
    "reverseListingOrder": "...
```

Example 80. Relational database

<table>
<thead>
<tr>
<th>members</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>role</td>
</tr>
<tr>
<td>listingOrder</td>
</tr>
<tr>
<td>reverseListingOrder</td>
</tr>
</tbody>
</table>

5.4 **relationType**

Represents one of possible values for the type of relation.

Child of

- lexicographicResource

Contents

- **value REQUIRED** (exactly one). Non-empty string.

- **description OPTIONAL** (zero or one). Non-empty string. A human-readable explanation of this relation type.

- **scope OPTIONAL** (zero or one). Non-empty string. Specifies restrictions on member of relations of this type. The possible values are:
  - **sameEntry**: members must be within of the same entry
• **sameResource**: members must be within the same lexicographicResource

• any (default): no restriction

• **memberRole** OPTIONAL (zero or more).

• **sameAs** OPTIONAL (zero or more).

**Example 81. XML**

```xml
<relationType value="..." scope="...">
   <description>...</description>
   <memberRole.../>
   <sameAs.../>
</relationType>
```

**Example 82. JSON**

```json
{
   "value": "...",
   "scope": "...",
   "memberRoles": [...],
   "sameAs": ["..."]
}
```

**Example 83. Relational database**

![Relation Types Diagram]

### 5.5 **memberRole**

Represents one of possible values for the role of **member**, as well as various restrictions on relation member having this role.

**Child of**

• **relationType**

**Contents**

• **value** REQUIRED (exactly one). String. If the value is empty, then members having this role do not need to have a role property.
- **description** OPTIONAL (zero or one). Non-empty string. A human-readable explanation of this member role.

- **memberType** REQUIRED (exactly one). Non-empty string. A restriction on the types of objects that can have this role. The possible values are:
  - **sense**: the object that has this role must be a sense.
  - **entry**: the object that has this role must be an entry.
  - **itemMarker**: the object that has this role must be an itemMarker (from the Linking module).

- **min** OPTIONAL (zero or one). Number. Says that relations of this type must have at least this many members with this role. If omitted then there is no lower limit (effectively, zero).

- **max** OPTIONAL (zero or one). Number. Says that relations of this type may have at most this many members with this role. If omitted then there is no upper limit.

- **action** REQUIRED (exactly one). Non-empty string. Gives instructions on what machine agents should do when showing this relation to a human user (either on its own or in the context of one of its members). The possible values are:
  - **embed**: Members that have this role should be shown in their entirety, i.e. the entire entry or the entire sense. This is suitable for the relation between entries and subentries, or senses and subsenses.
  - **navigate**: Members that have this role should not be shown in their entirety, but a navigable (e.g. clickable) link should be provided. This is suitable for the relation between synonyms, for example.
  - **none**: Members that have this role should not be shown.

- **sameAs** OPTIONAL (zero or more).

**Example 84. XML**

```xml
<memberRole value="..." memberType="..." min="..." max="..." action="...">
  <description></description>
  <sameAs.../>
</memberRole>
```

**Example 85. JSON**

```json
{
  "value": "...",
  "description": "...",
  "memberType": "...",
  "min": "...",
  "max": "...",
  "action": "...",
  "sameAs": [...]
}
```
5.6 Extensions to `sameAs`

Extends the `sameAs` object type from the Core.

*Can additionally be a child of*

- `relationType`
- `memberRole`

Example 87. Relational database
6 DMLex Inline Markup Module

This module makes it possible to mark up substrings inside the string values of certain objects and to attach properties to them.

It is up to the implementer to decide how to implement inline markup in an implementation of the DMLex Inline Markup module, whether in-place (as XML) or as stand-off markup (for example through start and end indexes).

6.1 Extensions to headword

Extends the headword object type from the Core.

Additional contents

- placeholderMarker OPTIONAL (zero, one or more)

Example 88. XML

```xml
<headword>
  ...<placeholderMarker>...</placeholderMarker>...
</headword>
```

Example 89. JSON

```json
{
  ..., 
  "headword": "...",
  "placeholderMarkers": [...],
  ...
}
```

6.2 Extensions to headwordTranslation

Extends the headwordTranslation object type from the Crosslingual module.

Additional contents

- placeholderMarker OPTIONAL (zero, one or more)

Example 90. XML

```xml
<headwordTranslation>
  <text>
    ...<placeholderMarker>...</placeholderMarker>...
  </text>
</headwordTranslation>
```
6.3 placeholderMarker

Marks up a substring inside a headword or inside a headword translation which is not part of the expression itself but stands for things that can take its place. An application can use the inline markup to format the placeholders differently from the rest of the text, to ignore the placeholder in full-text search, and so on. Examples: Section 8.20, “Using placeholderMarker”, Section 8.21, “Using placeholderMarker in a bilingual lexicographic resource”.

Child of

- headword
- headwordTranslation

Example 92. XML

```xml
<placeholderMarker>...</placeholderMarker>
```

Example 93. JSON

```json
{
  "startIndex": ...
}
```

Example 94. Relational databases

<table>
<thead>
<tr>
<th>placeholderMarkers</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK: id</td>
</tr>
<tr>
<td>FK: entryID</td>
</tr>
<tr>
<td>startIndex</td>
</tr>
<tr>
<td>endIndex</td>
</tr>
</tbody>
</table>

6.4 Extensions to definition

Extends the definition object type from the Core.
Additional contents

- headwordMarker OPTIONAL (zero, one or more)
- itemMarker OPTIONAL (zero, one or more)

Example 95. XML

```xml
<definition...>
  ...
  <headwordMarker>...</headwordMarker>
  ...
  <itemMarker...>...</itemMarker>
  ...
</definition>
```

Example 96. JSON

```json
{
  "text": "...",
  "headwordMarkers": [...],
  "itemMarkers": [...],
  ...
}
```

6.5 Extensions to example

Extends the example object type from the Core.

Additional contents

- headwordMarker OPTIONAL (zero, one or more)
- itemMarker OPTIONAL (zero, one or more)

Example 97. XML

```xml
<example>
  <text>
    ...
    <headwordMarker>...</headwordMarker>
    ...
    <itemMarker...>...</itemMarker>
    ...
  </text>
</example>
```
6.6 Extensions to exampleTranslation

Extends the `exampleTranslation` object type from the Crosslingual module.

Additional contents

- `headwordMarker` OPTIONAL (zero, one or more)
- `itemMarker` OPTIONAL (zero, one or more)

Example 99. XML

```xml
<exampleTranslation>
  <text>
    ...
    <headwordMarker>...</headwordMarker>
    ...
    <itemMarker>...</itemMarker>
    ...
  </text>
</exampleTranslation>
```

Example 100. JSON

```json
{
  "text": "...",
  "headwordMarkers": [...],
  "itemMarkers": [...],
  ...
}
```

6.7 headwordMarker

Marks up a substring inside an example, inside an example translation or inside a definition which corresponds to the headword (or to a translation of the headword). An application can use the inline markup to highlight the occurrence of the headword for human readers through formatting. Example: Section 8.22, “Using headwordMarker”.

Child of

- definition
Example 101. XML

```xml
<headwordMarker>...</headwordMarker>
```

Example 102. JSON

```json
{
  "startIndex": ...,
  "endIndex": ...
}
```

Example 103. Relational databases

<table>
<thead>
<tr>
<th>headwordMarkers</th>
</tr>
</thead>
<tbody>
<tr>
<td>PK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td>FK</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

6.8 itemMarker

Marks up a substring other than the headword inside an example, inside an example translation or inside a definition. An application can use the inline markup to highlight collocates or constituents. Example: Section 8.23, “Using itemMarker”.

Child of

- definition
- example
- exampleTranslation

Contents

- id OPTIONAL (zero or one). A unique identifier of the marker. Markers which have identifiers are capable of being involved in relations created with the Linking module.

- lemma OPTIONAL (zero or one). Non-empty string. The lemmatized form of the collocate. An application can use it to provide a clickable link for the user to search for the lemma in the rest of the lexicographic resource or on the web. (If you want to link the collocate explicitly to a specific entry or to a specific sense in your lexicographic resource, or even in an external lexicographic resource, you can use the Linking Module for that.)
- **itemRole** OPTIONAL (zero, one or more). Non-empty string. Can be used to communicate facts about the role of the item in the sentence, for example its syntactic role (subject, direct object etc.), its semantic role (agent, affected etc) or its semantic type (human, institution etc.) The `tag` object type can be used to explain and/or constrain the item types that are allowed to appear in the lexicographic resource.

*Example 104. XML*

```xml
<itemMarker id="..." lemma="...">
  ...
  <itemRole value="...">
  </itemMarker>
```

*Example 105. JSON*

```json
{
  "id": "...",
  "startIndex": ...,
  "endIndex": ...,
  "lemma": "...",
  "itemRoles": ["..."]
}
```

*Example 106. SQL*

```
itemMarkers
+------------+
| id         |
| definitionID|
| exampleID  |
| exampleTranslationID |
| startIndex |
| endIndex   |
| lemma      |

itemMarkerRoles
+------------+
| id         |
| itemMarkerID |
| role       |
```
7 Etymology Module

Extends DMLex Core to support the modelling of etymological information in dictionaries.

7.1 Extensions to entry

Additional children:

```
entry: ...
    etymology: (0..n)
```

7.1.1 XML

```
<entry>
    ...
    <etymology>...</etymology>
</entry>
```

7.1.2 JSON

```
{
    "etymology": ...
}
```

7.1.3 RDF

```
<Entry> dmlex:etymology ... .
```

7.2 etymology

An etymology represents the historical derivation of a word.

```
etymology:
    etymDescription: (0..n)
    etymon: (0..n)
    multiEtymon: (0..n)
```

7.2.1 XML

```
<etymology>
```
7.2.2 JSON

```
{
    "etymDescription": "...",
    "etymon": "...",
    "multiEtymon": "...
```

7.2.3 RDF

```
<entry> dmlex:etymology [ 
    dmlex:etymDescription "..."; 
    dmlex:etymon ..., 
    dmlex:multiEtymon ... ] .
```

7.3 etymDescription

A plain text form of the etymology, which may contain notes about the etymology. This may be used instead or alongside a structured set of etymon objects.

etymDescription: <string>

7.3.1 XML

```
<etymDescription>... </etymDescription>
```

7.3.2 JSON

```
{
    "value": "...
```

7.3.3 RDF

```
<etymololgy> dmlex:etymDescription [ 
```
7.4 **etymon**

Represents a form (typically a word) which is the etymological origin of the entry or another etymologically related form

```xml
<etymon id="..." href="...">
  <text>...</text>
  <type>...</type>
  <language>...</language>
  <note>...</note>
  <reconstructed>...</reconstructed>
  <label>...</label>
  <etymTranslation>...</etymTranslation>
  <etymDate>...</etymDate>
</etymon>
```

7.4.2 JSON

```json
{
  "text": "...",
  "type": "...",
  "language": "...",
  "note": "...",
  "reconstructed": true,
  "label": "...",
  "etymTranslation": [...],
  "etymDate": ...
}
```

7.4.3 RDF

```xml
<etymon>
```

```xml
<etymon>
```
Comments

- Etymons have ids to allow etymons to be members of relations
- The type of the etymology may have typical values including derivation, cognate or borrowing. Values can be specified using tag objects.
- The language of the origin form should be specified with a EtymonLanguage mapping.
- The note contains extra information about the language, for example the approximate time (e.g., 16th century) or geographical variants
- reconstructed indicates that the form is reconstructed and not attested in any corpus
- The label indicates the grammatical category of the etymon. Values can be specified using tag objects.
- The href is a reference to a source for this etymology in an external resource
- If this etymon is part of a multietymon (a child of MultiEtymon) the listingOrder indicates the order of this etymon. If this etymon is not part of a multietymon, then indicates its position among other etymons and multietymons in the entry. This value may be implicit in some serializations.
- The etymDate indicates the time period the etymological word was used in. For multi-etymons there SHOULD be no dates.

7.5 multiEtymon

Indicates a combination of multiple historical or borrowed forms that have been combined to make this entry.

multiEtymon: <id>
  etymon (2..n)
  type: (0..1) <string>
  language: (1..1) <string>
  note: (0..1) <string>
  reconstructed: (0..1) <boolean>
  label: (0..1) <string>
  href: (0..1) <url>
  listingOrder: (1..1) <number>
  etymTranslation: (0..n)
  etymDate: (0..1)

7.5.1 XML

  <multiEtymon id="..." href="...">
    <etymon>...</etymon>
    <etymon>...</etymon>
    <type>...</type>
    <language>...</language>
    <note>...</note>
7.5.2 JSON

```
{
  "etymon": [...],
  "type": "...",
  "language": "...",
  "note": "...",
  "reconstructed": true,
  "label": "...",
  "etymTranslation": [...],
  "etymDate": ...
}
```

7.5.3 RDF

```
<multiEtymon>
  dmlex:etymon ... ;
  dmlex:type "..." ;
  dmlex:language "..." ;
  dmlex:note "..." ;
  dmlex:reconstructed true ;
  dmlex:etymonLabel "..." ;
  dmlex:listingOrder 0 ;
  dmlex:etymTranslation ... ;
  dmlex:etymDate ... .
</multiEtymon>
```

7.6 etymTranslation

Gives a translation of a historical or borrowed form in the language of the dictionary

```
etymTranslation: <value>
```

7.6.1 XML

```
<etymTranslation>...</etymTranslation>
```

7.6.2 JSON

```
{
}
```
7.6.3 RDF

<etymon> dmlex:etymTranslation [  
  dmlex:value "..." ] .

7.7 **etymDate**

Gives a period of time for which an etymology was valid

etymDate:
  start: (0..1) <string>  
  end: (0..1) <string>

7.7.1 XML

<etymDate start="..." end="..."/>

7.7.2 JSON

{
  "start": "...",
  "end": "...",
}

7.7.3 RDF

<etymon> dmlex:etymDate [  
  dmlex:start "..." ;  
  dmlex:end "..." ].

Comments

- start and end indicate the date of when this etymon was used. This can be a year in the Gregorian calendar or an approximate value.

7.8 Extensions to **tag**

Additional allowed values for the target property, allows the specification of values for the etymon-Type and etymonLabel properties of etymon.
7.8.1 XML

```xml
<tag>
  <target value="etymonType"/>
  <target value="etymonLabel"/>
</tag>
```

7.8.2 JSON

```json
{
  "targets": ["etymonType", "etymonLabel"]
}
```

7.8.3 RDF

```xml
<tag> dmlex:target dmlex:etymonType, dmlex:etymonLabel .
```

7.9 Extensions to lexicographicResource

Additional children:

```xml
lexicographicResource ...
  etymonLanguage: (0..n)
```

7.9.1 XML

```xml
<lexicographicResource>
  <etymonLanguage>...
  </etymonLanguage>
</lexicographicResource>
```

7.9.2 JSON

```json
{}
```
7.10 etymonLanguage

Represents one of several allowed values for the language property of etymon objects. Note that as etymologies frequently refer to languages that are not covered by ISO standards it is necessary to define codes for all languages used in definitions.

```
etymonLanguage: <value>
   iso639-1: (0..1) <string of 2 lowercase letters>
   iso639-3: (0..1) <string of 3 uppercase letters>
   displayValue: (0..1) <string>
```

7.10.1 XML

```
<etymonLanguage value="...">
   <iso639-1>...</iso639-1>
   <iso639-3>...</iso639-3>
   <displayValue>...</displayValue>
</etymonLanguage>
```

7.10.2 JSON

```
{
   "value": "...",
   "iso639-1": "...",
   "iso639-3": "...",
   "displayValue": "...
```

7.10.3 RDF

```
<etymonLanguage> dmlex:value "...";
   dmlex:iso639-1 "...";
   dmlex:iso639-3 "...";
   dmlex:displayValue "...
```
• The language may be specified with either iso639-1 and/or iso639-3 code in the ISO 639 standard if it exists
• value indicates value used by the language property of a etymon (e.g. ger). displayValue indicates a natural language name for the language, e.g., “Modern High German”

7.11 Extensions to memberRole

This extension makes it possible for etymons to be linked (through relation objects from the Linking module) to other entities such as other etymons or entries in other dictionaries.

Additional allowed values for the memberType property:

```
memberRole: "etymon"
```

7.11.1 XML

```
<memberRole role="etymon"/>
```

7.11.2 JSON

```json
{
    "memberRole": "etymon"
}
```

7.11.3 RDF

```
<relationType> dmlex:memberRole dmlex:etymonRole .
```
8 Examples

This section gives examples which show how to use DMLex to model lexicographic resources. The examples are shown in three formalisms: NVH, XML and JSON.

Each example is shown in NVH first. NVH (Name-Value Hierarchy)\(^1\) is a concise serialization language designed for lexicographic data. NVH encodes data as a hierarchical list of names, values and children, which corresponds exactly to DMLex’s own data model. We use NVH here in order to demonstrate the object model at an abstract level.

After that, each example is shown in XML and JSON, two popular serialization languages. The XML and JSON encoding shown here follows DMLex’s own implementation guidance for XML and JSON.

8.1 A basic entry

This is a basic, beginner-level example of how to use DMLex to represent a simple monolingual lexicographic resource consisting of one entry with two senses. It demonstrates some of the basic features of DMLex Core: how to subdivide an entry into senses, how attach various data such as definition, part-of-speech labels to entries and senses, and how to add labels to various objects such as senses and examples.

8.1.1 NVH

```
lexicographicResource: my-dictionary
  entry: abandon-verb
    headword: abandon
    partOfSpeech: verb
    sense: abandon-verb-1
      definition: to suddenly leave a place or a person
      example: I'm sorry I abandoned you like that.
      example: Abandon ship!
        label: idiom
    sense: abandon-verb-2
      label: mostly-passive
      definition: to stop supporting an idea
      example: That theory has been abandoned.
```

8.1.2 XML

```xml
<lexicographicResource id="my-dictionary">
  <entry id="abandon-verb">
    <headword>abandon</headword>
    <partOfSpeech value="verb"/>
    <sense id="abandon-verb-1">
      <definition>to suddenly leave a place or a person</definition>
      <example>
        <text>I'm sorry I abandoned you like that.</text>
      </example>
      <example>
        <text>Abandon ship!</text>
        <label value="idiom"/>
      </example>
    </sense>
    <sense id="abandon-verb-2">
      <label value="mostly-passive"/>
      <definition>to stop supporting an idea</definition>
      <example>
        <text>That theory has been abandoned.</text>
      </example>
    </sense>
  </entry>
</lexicographicResource>
```
<definition>to stop supporting an idea</definition>
<example>
  <text>That theory has been abandoned.</text>
</example>
</sense>
</entry>

8.1.3 JSON

```json
{
  "id": "my-dictionary",
  "entry": {
    "id": "abandon-verb",
    "headword": "abandon",
    "partsOfSpeech": ["verb"],
    "senses": [{
      "id": "abandon-verb-1",
      "definitions": [{
        "text": "to suddenly leave a place or a person"
      }],
      "examples": [{
        "text": "I'm sorry I abandoned you like that."
      }, {
        "text": "Abandon ship!",
        "labels": ["idiom"]
      }]
    }, {
      "id": "abandon-verb-2",
      "labels": ["mostly-passive"],
      "definitions": ["to stop supporting an idea"],
      "examples": [{
        "text": "That theory has been abandoned."
      }]
    }]
  }
}
```

8.2 How to use `inflectedForm`

This is an entry from a hypothetical Irish dictionary for the headword "folúsghlantóir" ("vacuum cleaner") which gives its two inflected forms, the singular genitive and the plural.

8.2.1 NVH

```xml
<entry>folúsghlantóir-n
  <headword>folúsghlantóir</headword>
  <partOfSpeech>n-masc</partOfSpeech>
  <inflectedForm>folúsghlantóra</inflectedForm>
  <inflectedTag>sg-gen</inflectedTag>
  <inflectedForm>folúsghlantóirí</inflectedForm>
  <inflectedTag>pl</inflectedTag>
  <sense>...</sense>
</entry>
```
8.2.2 XML

```xml
<entry id="folúsghlantóir-n">
  <headword>folúsghlantóir</headword>
  <partOfSpeech value="n-masc"/>
  <inflectedForm inflectedTag="sg-gen">folúsghlantóra</inflectedForm>
  <inflectedForm inflectedTag="pl">folúsghlantóirí</inflectedForm>
  <sense>...</sense>
</entry>
```

8.2.3 JSON

```json
{
  "id": "folúsghlantóir-n",
  "headword": "folúsghlantóir",
  "partsOfSpeech": ["n-masc"],
  "inflectedForms": [{
    "text": "folúsghlantóra",
    "inflectedTag": "sg-gen",
  }, {
    "text": "folúsghlantóirí",
    "inflectedTag": "pl",
  }],
  "senses": [...]
}
```

8.3 Pronunciation given as transcription

8.3.1 NVH

entry: aardvark-noun
headword: aardvark
pronunciation:
  transcription: a:rdva:rk
sense: ...

8.3.2 XML

```xml
<entry id="aardvark-noun">
  <headword>aardvark</headword>
  <pronunciation>
    <transcription>a:rdva:rk</transcription>
  </pronunciation>
  <sense>...</sense>
</entry>
```

8.3.3 JSON

```json
dmlex-v1.0-wd01
Standards Track Work Product
Copyright © OASIS Open
2022. All rights reserved.
21 October 2022
Page 59 of 101
```
8.4 Pronunciation given as a sound file

8.4.1 NVH

entry: aardvark-noun
   headword: aardvark
   pronunciation:
      soundFile: aardvark.mp3
   sense: ...

8.4.2 XML

<entry id="aardvark-noun">
   <headword>aardvark</headword>
   <pronunciation soundFile="aardvark.mp3"/>
   <sense>...</sense>
</entry>

8.4.3 JSON

{
   "id": "aardvark-noun",
   "headword": "aardvark",
   "pronunciations": [{
      "soundFile": "aardvark.mp3"
   }],
   "senses": [...]}

8.5 Pronunciation given both ways

8.5.1 NVH

entry: aardvark-noun
   headword: aardvark
   pronunciation:
      transcription: a:rdva:rk
      soundFile: aardvark.mp3
8.5.2 XML

<entry id="aardvark-noun">
  <headword>aardvark</headword>
  <pronunciation soundFile="aardvark.mp3">
    <transcription>a:rdva:rk</transcription>
  </pronunciation>
  <sense>...</sense>
</entry>

8.5.3 JSON

{
  "id": "aardvark-noun",
  "headword": "aardvark",
  "pronunciations": [{
    "soundFile": "aardvark.mp3",
    "transcriptions": [{"text": "a:rdva:rk"}]
  }],
  "senses": [...]
}

8.6 How to use tag

This is an entry from a hypothetical Irish dictionary for the headword "folúsghlantóir" ("vacuum cleaner"). The meaning of the various tags used in this entry is explained in the tag objects.

8.6.1 NVH

lexicographicResource: my-irish-dictionary
  language: ga
  entry: folúsghlantóir-n
    headword: folúsghlantóir
    partOfSpeech: n-masc
    inflectedForm: folúsghlantóra
      inflectedTag: sg-gen
    inflectedForm: folúsghlantóirí
      inflectedTag: pl
    sense: ...
  tag: n-masc
    description: noun, masculine
    target: partOfSpeech
  tag: n-fem
    description: noun, feminine
    target: partOfSpeech
  tag: sg-gen
    description: singular genitive
    target: inflectedTag
    partOfSpeechConstraint: n-masc
8.6.2 XML

```xml
<lexicographicResource id="my-irish-dictionary" language="ga">
  <entry id="folúsghlantóir-n">
    <headword>folúsghlantóir</headword>
    <partOfSpeech value="n-masc"/>
    <inflectedForm inflectedTag="sg-gen">folúsghlantóra</inflectedForm>
    <inflectedForm inflectedTag="pl">folúsghlantóirí</inflectedForm>
    <sense>...</sense>
  </entry>
  <tag value="n-masc">
    <description>noun, masculine</description>
    <target value="partOfSpeech"/>
  </tag>
  <tag value="n-fem">
    <description>noun, feminine</description>
    <target value="partOfSpeech"/>
  </tag>
  <tag value="sg-gen">
    <description>singular genitive</description>
    <target value="inflectedTag"/>
    <partOfSpeechConstraint value="n-masc"/>
    <partOfSpeechConstraint value="n-fem"/>
  </tag>
  <tag value="pl">
    <description>plural</description>
    <target value="inflectedTag"/>
    <partOfSpeechConstraint value="n-masc"/>
    <partOfSpeechConstraint value="n-fem"/>
  </tag>
</lexicographicResource>
```

8.6.3 JSON

```json
{
  "id": "my-irish-dictionary",
  "language": "ga",
  "entries": [
    {
      "id": "folúsghlantóir-n",
      "headword": "folúsghlantóir",
      "partsOfSpeech": ["n-masc"],
      "inflectedForms": [
        {
          "text": "folúsghlantóra",
          "inflectedTag": "sg-gen",
        },
        {
          "text": "folúsghlantóirí",
          "inflectedTag": "pl",
        }
      ]
    }
  ]
}
```
8.7 Mapping tag to external inventories

This shows how to map the value of a tag such as \text{n-masc} and \text{n-fem} to items in an external inventory such as LexInfo.

8.7.1 NVH

\text{tag: n-masc}
\begin{itemize}
\item description: noun, masculine
\item target: partOfSpeech
\item sameAs: http://www.lexinfo.net/ontology/3.0/lexinfo\#noun
\item sameAs: http://www.lexinfo.net/ontology/3.0/lexinfo\#masculine
\end{itemize}

\text{tag: n-fem}
\begin{itemize}
\item description: noun, feminine
\item target: partOfSpeech
\item sameAs: http://www.lexinfo.net/ontology/3.0/lexinfo\#noun
\item sameAs: http://www.lexinfo.net/ontology/3.0/lexinfo\#feminine
\end{itemize}

8.7.2 XML

\begin{verbatim}
<tag value="n-masc">
  <description>noun, masculine</description>
  <target value="partOfSpeech"/>
  <sameAs uri="http://www.lexinfo.net/ontology/3.0/lexinfo\#noun"/>
  <sameAs uri="http://www.lexinfo.net/ontology/3.0/lexinfo\#masculine"/>
</tag>

<tag value="n-fem">
  <description>noun, feminine</description>
  <target value="partOfSpeech"/>
  <sameAs uri="http://www.lexinfo.net/ontology/3.0/lexinfo\#noun"/>
</tag>
\end{verbatim}
8.7.3 JSON

```
{
    "tags": [{
        "value": "n-masc",
        "description": "noun, masculine",
        "targets": ["partOfSpeech"],
        "sameAs": [
            "http://www.lexinfo.net/ontology/3.0/lexinfo#noun",
            "http://www.lexinfo.net/ontology/3.0/lexinfo#masculine"
        ]
    }, {
        "value": "n-fem",
        "description": "noun, feminine",

8.8 Defining a bilingual lexicographic resource

This defines a lexicographic resource where the source language is German and the translation language is English and the English translations are going to come with pronunciation transcriptions in English IPA.

8.8.1 NVH

```
lexicographicResource: deueng
    title: My German-English Dictionary
    language: de
    translationLanguage: en
```

8.8.2 XML

```
<lexicographicResource id="deueng" language="de">
    <title>My German-English Dictionary</title>
    <translationLanguage langCode="en"/>
    ...
</lexicographicResource>
```

8.8.3 JSON

```
{
}
```
8.9 Defining a multilingual lexicographic resource

This defines a lexicographic resource where the source language is Irish and the translation languages are English, German and Czech.

8.9.1 NVH

```xml
<lexicographicResource id="irish-multilingual" language="ga">
  <title>My Irish-Multilingual Dictionary</title>
  <translationLanguage langCode="en"/>
  <translationLanguage langCode="de"/>
  <translationLanguage langCode="cs"/>
  ...
</lexicographicResource>
```

8.9.3 JSON

```json
{
  "id": "irish-multilingual",
  "title": "My Irish-Multilingual Dictionary",
  "language": "ga",
  "translationLanguages": ["en", "de", "cs"],
  ...
}
```

8.10 How to use headwordTranslation in a bilingual lexicographic resource

This is an entry from a hypothetical English-German dictionary for English-speaking learners of German.

8.10.1 NVH
entry: doctor-n
  headword: doctor
  sense: doctor-n-1
    indicator: medical doctor
    headwordTranslation: Arzt
      partOfSpeech: n-masc
    headwordTranslation: Ärztin
      partOfSpeech: n-fem
  sense: doctor-n-2
    indicator: academic title
    headwordTranslation: Doktor
      partOfSpeech: n-masc
    headwordTranslation: Doktorin
      partOfSpeech: n-fem
  label: rare

8.10.2 XML

<entry id="doctor-n">
  <headword>doctor</headword>
  <sense id="doctor-n-1">
    <indicator>medical doctor</indicator>
    <headwordTranslation>
      <text>Arzt</text>
      <partOfSpeech value="n-masc"/>
    </headwordTranslation>
    <headwordTranslation>
      <text>Ärztin</text>
      <partOfSpeech value="n-fem"/>
    </headwordTranslation>
  </sense>
  <sense id="doctor-n-2">
    <indicator>academic title</indicator>
    <headwordTranslation>
      <text>Doktor</text>
      <partOfSpeech value="n-masc"/>
    </headwordTranslation>
    <headwordTranslation>
      <text>Doktorin</text>
      <partOfSpeech value="n-fem"/>
    </headwordTranslation>
  </sense>
</entry>

8.10.3 JSON

      "headword": "sell",
      "senses": [{
        "id": "sell-1",
        "definition": "exchange something for money"
      }]
    }
  }]}
8.14.4 Suggested rendering for human users

**buy**

- get something by paying money for it

**sell**

opposite meaning:

8.15 Modelling synonyms

We have three German entries with one sense each, two which mean "sea" and one which means "ocean". We want to set up a relation which brings these three sense together as near-synonyms.

8.15.1 NVH

```
lexicographicResource: my-dictionary
language: de
translationLanguage: en
entry: die-see
  headword: See
  partOfSpeech: n-fem
  sense: die-see-1
  headwordTranslation: sea
entry: das-meer
  headword: Meer
  partOfSpeech: n-neut
  sense: das-meer-1
  headwordTranslation: sea
entry: der-ozean
  headword: Ozean
  partOfSpeech: n-masc
  sense: der-ozean-1
  translation: ocean
relation: syns
  description: words that mean sea and ocean
  member: die-see-1
  member: das-meer-1
```
8.15.2 XML

```
<lexicographicResource id="my-dictionary" language="en">
  <translationLanguage langCode="de"/>
  <entry id="die-see">
    <headword>See</headword>
    <partOfSpeech value="n-fem"/>
    <sense id="die-see-1">
      <headwordTranslation><text>sea</text></headwordTranslation>
    </sense>
  </entry>
  <entry id="das-meer">
    <headword>Meer</headword>
    <partOfSpeech value="n-neut"/>
    <sense id="das-meer-1">
      <headwordTranslation><text>sea</text></headwordTranslation>
    </sense>
  </entry>
  <entry id="der-ozean">
    <headword>Ozean</headword>
    <partOfSpeech value="n-masc"/>
    <sense id="der-ozean-1">
      <headwordTranslation><text>ocean</text></headwordTranslation>
    </sense>
  </entry>
  <relation type="syns">
    <description>words that mean sea and ocean</description>
    <member idref="die-see-1"/>
    <member idref="das-meer-1"/>
    <member idref="der-ozean-1"/>
  </relation>
</lexicographicResource>
```

8.15.3 JSON

```
{
  "id": "my-dictionary",
  "language": "de",
  "translationLanguages": ["en"],
  "entries": [
    {
      "id": "die-see",
      "headword": "See",
```
8.15.4 Suggested rendering for human users

See feminine noun

- sea same or similar meaning: Meer, Ozean

8.16 Modelling variants

We have two entries in our lexicographic resource, one for the headword "colour" and one for the headword "color". We want to create a relation to represent the fact that these are spelling variants.

8.16.1 NVH
8.16.2 XML

```
<lexicographicResource id="my-dictionary" language="en">
  <entry id="colour">
    <headword>colour</headword>
    <partOfSpeech value="n"/>
    <label value="europeanSpelling"/>
    <sense id="colour-1">
      <definition>red, blue, yellow etc.</definition>
      <example><text>What is your favourite colour?</text></example>
    </sense>
  </entry>
  <entry id="color">
    <headword>color</headword>
    <partOfSpeech value="n"/>
    <label value="americanSpelling"/>
  </entry>
  <relation type="vars">
    <member idref="colour"/>
    <member idref="color"/>
  </relation>
  <relationType type="vars">
    <description>variants, words which differ only in spelling</description>
    <memberRole memberType="entry" min="2" action="navigate"/>
  </relationType>
</lexicographicResource>
```

8.16.3 JSON

```
{
  "id": "my-dictionary",
  "language": "en",
```
8.16.4 Suggested rendering for human users

**colour** noun, European spelling

- red, blue, yellow etc. What is your favourite colour?

see also: **color**

8.17 Modelling subsenses

We have an entry for the noun "colour" with four senses. We want to express the fact that senses number two and three are subsenses of sense number one, and should be displayed as such to human users.

8.17.1 NVH
sense: colour-2
  definition: not being black and white
  example: Back then owning a colour TV meant you were rich.
sense: colour-3
  definition: a sign of a person's race
  example: We welcome people of all creeds and colours.
sense: colour-4
  definition: interest or excitement
  example: Examples add colour to your writing.

relation: subsensing

8.17.4 Suggested rendering for human users

colour

1. red, blue, yellow etc. What is your favourite colour?
   a. not being black and white Back then owning a colour TV meant you were rich.
   b. a sign of a person's race We welcome people of all creeds and colours.

2. interest or excitement Examples add colour to your writing.

8.18 Modelling subentries (at subsense level)

We have an entry for the adjective "safe" with two senses, and an entry for the multi-word expression "better safe than sorry" with one sense. We want to express the fact that the multi-word entry should appear under the first sense of "safe" as a subentry.

8.18.1 NVH

```xml
<lexicographicResource: my-dictionary
  language: en
  entry: safe
    headword: safe
    sense: safe-1
      indicator: protected from harm
      example: It isn't safe to park here.
    sense: safe-2
      indicator: not likely to cause harm
      example: Is the ride safe for a small child?
  entry: better-safe
    headword: better safe than sorry
    sense: better-safe-1
      definition: you should be careful even if it seems unnecessary
      relation: subentrying
```
8.18.2 XML

```xml
<lexicographicResource id="my-dictionary" language="en">
  <entry id="safe">
    <headword>safe</headword>
    <sense id="safe-1">
      <indicator>protected from harm</indicator>
      <example><text>It isn't safe to park here.</text></example>
    </sense>
    <sense id="safe-2">
      <indicator>not likely to cause harm</indicator>
      <example><text>Is the ride safe for a small child?</text></example>
    </sense>
  </entry>
  <entry id="better-safe">
    <headword>better safe than sorry</headword>
    <sense id="better-safe-1">
      <definition>
        <text>you should be careful even if it seems unnecessary</text>
      </definition>
    </sense>
  </entry>
  <relation type="subentrying">
    <member idref="safe-1" role="container"/>
    <member idref="better-safe" role="subentry"/>
  </relation>
</lexicographicResource>
```

8.18.3 JSON

```json
{
}
```
safe

- protected from harm: It isn't safe to park here.
- better safe than sorry you should be careful even if it seems unnecessary
- not likely to cause harm: Is the ride safe for a small child?
better safe than sorry

- you should be careful even if it seems unnecessary

see also: safe

8.19 Modelling subentries (at sense level)

We have an entry for the word "bible" and another entry for the expression "the Bible". We want to make sure that, when a human user is viewing the entry for "bible", the entry for "the Bible" is shown as a subentry of it, as if it were its first sense.

8.19.1 NVH

```xml
<lexicographicResource id="my-dictionary" language="en">
  <entry id="the-bible">
    <headword>the Bible</headword>
    <Sense id="the-bible-1">
      <definition>the book considered holy by Christians</definition>
    </Sense>
  </entry>
  <entry id="bible">
    <headword>bible</headword>
    <sense id="bible-1">a book considered important for a subject</sense>
    <sense id="bible-2">
      <definition>a book considered important for a subject</definition>
    </sense>
    <relation id="subentrying">
      <member id="bible-1">
        <role>container</role>
      </member>
      <member id="the-bible">
        <role>subentry</role>
      </member>
      <relationType id="subentrying">
        <scope>sameResource</scope>
        <memberRole id="container">
          <memberType>sense</memberType>
          <min>1</min>
          <max>1</max>
          <action>navigate</action>
        </memberRole>
        <memberRole id="subentry">
          <memberType>entry</memberType>
          <min>1</min>
          <max>1</max>
          <action>embed</action>
        </memberRole>
      </relationType>
    </relation>
  </entry>
</lexicographicResource>
```

8.19.2 XML

```xml
<lexicographicResource id="my-dictionary" language="en">
  <entry id="the-bible">
    <headword>the Bible</headword>
    <sense id="the-bible-1">
      <definition>
        <text>the book considered holy by Christians</text>
      </definition>
    </sense>
  </entry>
</lexicographicResource>
```
<entry id="bible">
  <headword>bible</headword>
  <sense id="bible-1"/>
  <sense id="bible-2">
    <definition>
      <text>a book considered important for a subject</text>
    </definition>
  </sense>
</entry>

<relation type="subentrying">
  <member idref="bible-1" role="container"/>
  <member idref="the-bible" role="subentry"/>
</relation>

<relationType type="subentrying" scope="sameResource">
  <memberRole role="container" memberType="sense" min="1" max="1" action="navigate"/>
  <memberRole role="subentry" memberType="entry" min="1" max="1" action="embed"/>
</relationType>
</lexicographicResource>

8.19.3 JSON

```json
{
  "id": "my-dictionary",
  "language": "en",
  "entries": [{
    "id": "the-bible",
    "headword": "the Bible",
    "senses": [{
      "id": "the-bible-1",
      "definitions": [{"text": "the book considered holy by Christians"}]
    }]
  }, {
    "id": "bible",
    "headword": "bible",

    },
    {"role": "subentry", "memberType": "entry", "max": "1"}]
  }]
}
```
8.19.4 Suggested rendering for human users

bible
1. the Bible the book considered holy by Christians
2. a book considered important for a subject

Suggested rendering of the entry “the Bible” for human users:

the Bible
  • the book considered holy by Christians

                ],
                "exampleTranslations": [{
                    "text": "Koroner provedl pitvu."
                }]
            }]
        }
    ]
}
8.23 Using itemMarker

8.23.1 NVH

```
entry: autopsy
  headword: autopsy
  sense: autopsy-1
    headwordTranslation: pitva
    example: The coroner performed an autopsy.
      headwordMarker: autopsy
      itemMarker: performed
      lemma: perform
      exampleTranslation: Koroner provedl pitvu.
        headwordMarker: pitvu
        itemMarker: provedl
        lemma: provést
```
The coroner performed an autopsy.
9 DMLex XML serialization

9.1 Design principles

The XML serialization of DMLex shown in this document follows these principles:

- The top-level `lexicographicResource` object is implemented as an XML element.
- All other objects are implemented as XML attributes of their parents, unless:
  - the object has an arity other than `(0..1)` and `(1..1)`
  - or the object can have child objects
  - or the object's value is human-readable text, such as a headword or a definition.

In such cases the object is implemented as a child XML element of its parent.

9.2 DMLex namespaces and validation artifacts for its XML serialization

TBD...

9.3 Element: `<lexicographicResource>`

Implements the `lexicographicResource` data type.

Attributes:

- `@id` REQUIRED
- `@title` OPTIONAL
- `@uri` OPTIONAL
- `@language` REQUIRED

Child elements

- `<entry>` zero or more
- `<tag>` zero or more

Child elements if implementing the Crosslingual Module

- `<translationLanguage>` one or more

Child elements if implementing the Linking Module

- `<relation>` zero or more
  - `<relationType>` zero or more

9.4 Element: `<entry>`

Implements the `entry` data type.
Attributes:

- @id REQUIRED
- @homographNumber OPTIONAL

Child elements

- <headword> REQUIRED
- <partOfSpeech> zero or more
- <label> zero or more
- <pronunciation> zero or more
- <inflectedForm> zero or more
- <sense> zero or more

Child elements if implementing the Etymology Module

- <etymology> zero or more
10 DMLex JSON serialization

10.1 Design principles

The JSON serialization of DMLex shown in this document follows these principles:

• The top-level lexicographicResource object is implemented as a JSON object: {...}.

• All other objects are implemented as JSON name-value pairs inside their parent JSON object: "name": ...}.

• The values of objects are implemented:
  • If the object has an arity of (0..1) or (1..1):
    • If the object cannot have any child objects: as a string or number.
    • If the object can have child objects: as a JSON object.
  • If the object has any other arity:
    • If the object cannot have any child objects: as an array of strings or numbers.
    • If the object can have child objects: as an array of JSON objects.

10.2 Class: lexicographicResource

Implements the lexicographicResource data type.

Type

JSON object: {...}

Members

• "id" string REQUIRED
• "title" string OPTIONAL
• "uri" string OPTIONAL
• "language" string REQUIRED
• "entries" array of zero or more entry objects, OPTIONAL
• "tags" array of zero or more tag objects, OPTIONAL

Members if implementing the Crosslingual Module

• "translationLanguages" array of one or more translationLanguage objects, REQUIRED

Members if implementing the Linking Module

• "relations" array of zero or more relation objects, OPTIONAL
• "relationTypes" array of zero or more relationType objects, OPTIONAL
10.3 Class: entry

Implements the entry data type.

Type

JSON object: {...}

Members

- "id" string REQUIRED
- "headword" (string) REQUIRED
- "homographNumber" string OPTIONAL
- "partsOfSpeech" array of zero or more partOfSpeech objects, OPTIONAL
- "labels" array of zero or more label objects, OPTIONAL
- "pronunciations" array of zero or more pronunciation objects, OPTIONAL
- "inflectedForms" array of zero or more inflectedForm objects, OPTIONAL
- "senses" array of zero or more sense objects, OPTIONAL

Members if implementing the Etymology Module

- "etymologies" array of zero or more etymology objects, OPTIONAL
11 DMLex relational database serialization

11.1 Design principles

The relational database serialization of DMLex shown in this document follows these principles:

- The lexicographicResource object is implemented as a table. (Alternatively, it can be left unimplemented if the database is going to contain only one lexicographic resource.)

- Other objects with an arity other than \((0..1)\) and \((1..1)\) are implemented as tables.

- The values of objects, and objects with an arity of \((0..1)\) or \((1..1)\) are implemented as columns in those tables.

- The parent-child relation is implemented as a one-to-many relation between tables.

11.2 Table: lexicographicResources

Implements the lexicographicResource data type.

**Columns**

- id int primary key
- title varchar(255)
- uri varchar(255)
- language varchar(10)

**Processing Requirements**

- If the implementation contains only one lexicographic resource, then the lexicographicResource table is not REQUIRED to be unimplemented.

11.3 Table: entries

Implements the entry data type.

**Columns**

- lexicographicResourceId int foreign key references lexicographicResource(id)
- id int, primary key
- headword varchar(255)
- homographNumber int

**Comment**

If the implementation contains only one lexicographic resource, then the column lexicographicResourceId MAY remain unimplemented.
Appendix A References

This appendix contains the normative and informative references that are used in this document. Normative references are specific (identified by date of publication and/or edition number or Version number) and Informative references are either specific or non-specific.

While any hyperlinks included in this appendix were valid at the time of publication, OASIS cannot guarantee their long-term validity.

A.1 Normative references

[BCP 14] is a concatenation of [RFC 2119] and [RFC 8174]

[ EXAMPLE_ABBREV] N. Surname, A. Surname, Example Title, example.org/citetitle Example Citetitle, Month dd, yyyy.

A.2 Informative references (Informative)

[LDML] Unicode Locale Data Markup Language http://unicode.org/reports/tr35/

Appendix B Machine Readable Validation Artifacts (Informative)

CURRENTLY NO VALIDATION ARTIFACTS FORESEEN FOR THE OM.. JUST FOR SERIALIZATIONS

MAY LIST CONFORMANT ARTIFACTS FOR SPECIFIC SERIALIZATIONS AT A LATER STAGE
Appendix C Security and privacy considerations

Note

OASIS strongly recommends that Technical Committees consider issues that might affect safety, security, privacy, and/or data protection in implementations of their work products and document these for implementers and adopters. For some purposes, you may find it required, e.g. if you apply for IANA registration.

While it may not be immediately obvious how your work product might make systems vulnerable to attack, most work products, because they involve communications between systems, message formats, or system settings, open potential channels for exploit. For example, IETF [RFC 3552] lists “eavesdropping, replay, message insertion, deletion, modification, and man-in-the-middle” as well as potential denial of service attacks as threats that must be considered and, if appropriate, addressed in IETF RFCs.

In addition to considering and describing foreseeable risks, this section should include guidance on how implementers and adopters can protect against these risks.

We encourage editors and TC members concerned with this subject to read Guidelines for Writing RFC Text on Security Considerations, IETF [RFC 3552], for more information.
Appendix D Specification Change Tracking (Informative)

This appendix will contain tracked changes after the csprd01 phase will have been reached.
Appendix E Acknowledgements (Informative)

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

• Erjavec, Tomaž - JSI
• Filip, David - TCD, ADAPT Centre
• Jakubíček, Miloš - Lexical Computing
• Kernerman, Ilan - K Dictionaries
• Kosem, Iztok - JSI
• Krek, Simon - JSI
• McCrae, John - National University of Ireland Galway
• Machura, Milan - JSI
