# Modern ATB The Jones Act Solution

Chris Flanagan  
SNAME Maritime Technology Conference  
October 21, 2005

# Elements of Transportation Cost

- Storage and Distribution
- Marine Transportation – Our focus
  - Operating Expenses – people, maintenance, insurance
  - Voyage Expenses – fuel, port costs
  - Capital Investment
  - Parcel Size
  - Transportation Distance
  - Speed

# Tug-Barge Regulatory Environment

- USCG Navigation and Vessel Inspection Circular (NVIC) 2-81 – regulations pertaining to tug-barge combinations
- Push Mode Integrated Tug Barge (ITB)
  - Tug and Barge cannot operate separately
  - Treated like a ship by USCG
- Dual Mode Integrated Tug Barge (ATB)
  - Tug and Barge can separate and operate safely on tow line
  - Treated as two vessels by USCG
  - Industry has adopted the term Articulated Tug Barge (ATB) for the dual mode ITB

# Connection Systems for ATB

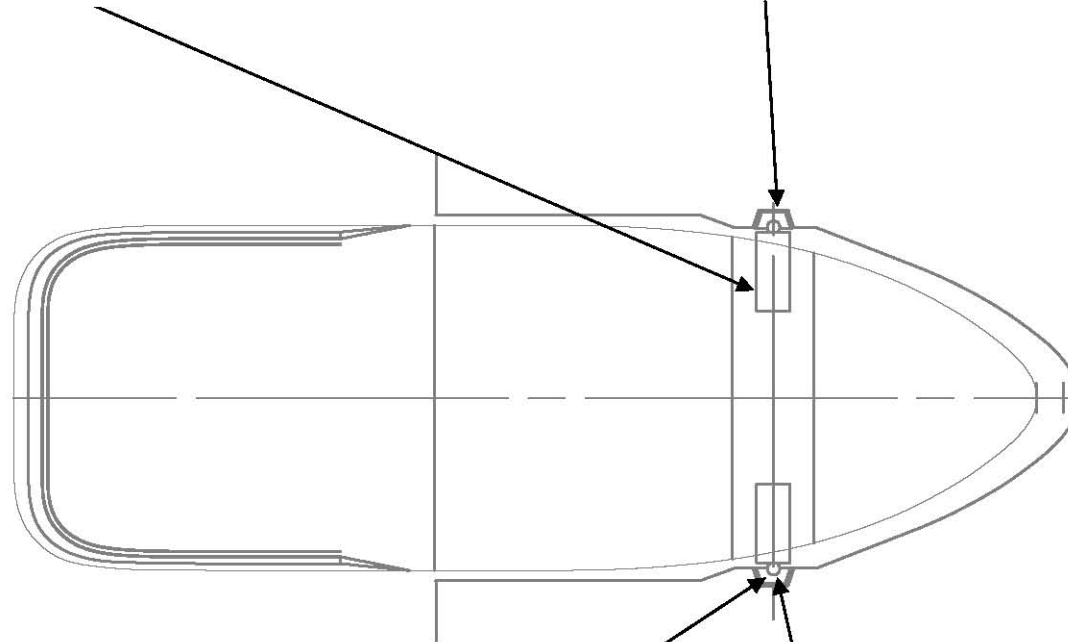

- Pin Type Systems
  - Pins on Tug extend into ladder in barge notch
  - Pins allow tug to pitch relative to barge but otherwise tug moves with barge
  - Includes Intercon
- Bludworth-Cook Marine System
  - Hydraulic caliper at tug bow
  - Vertical bar at apex of barge notch
  - Pads on boat sides position vessel in deep notch

# Intercon Coupler

RAM IS EXTENDED P/S BY AN  
INTEGRAL ELECTRIC  
MOTOR/GEAR/SCREW DRIVE  
SYSTEM

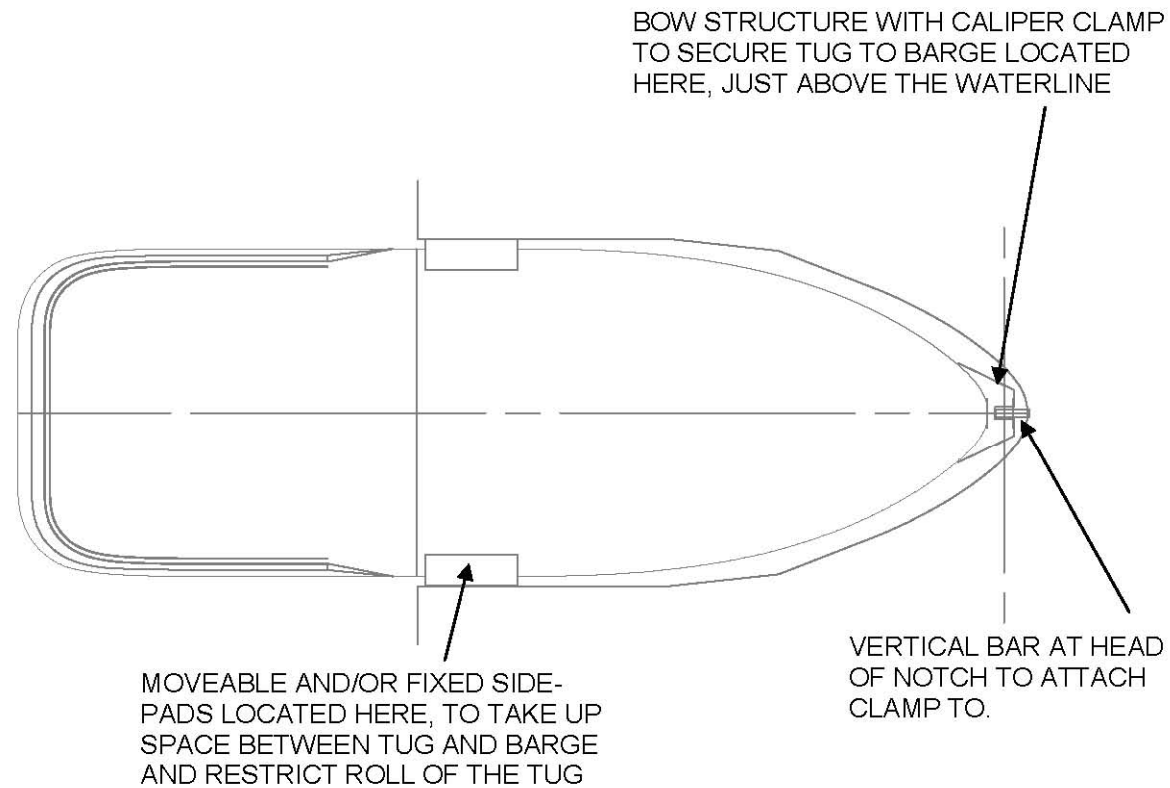

CONNECTING LADDER ON NOTCH  
WALL WITH MULTIPLE TEETH IN A  
CONTINUOUS  
VERTICAL LINE.

RAM/CYLINDER UNIT ON  
TUG P/S WITH BALL AND  
HELMET AT THE END

HELMET ENGAGES TEETH  
ON BARGE LADDER. SIDE TO  
SIDE MOTION ELIMINATED

# Bludworth-Cook Marine Coupler

# Self Propelled Tanker

- Complement - 21
- IFO-380
- 15 Knots
- Slow Speed Diesel
- Single Screw
- 330,000 bbls

# Traditional ATB

- Complement – 9
- Diesel Fuel
- 11 Knots
- Medium Speed Main Engine
- Twin Screw
- 240,000 bbls
- Intercon Coupler

# Next Generation ATB

- Complement – 12
- IFO-380
- 13 Knots
- Medium Speed Main Engines
- Twin Screw
- 330,000 bbls
- Intercon Coupler

# Vessel Comparison

	DH Conv.	Modern ATB	Tanker
Price	\$42.5M	\$77.5M	\$90M
Main Engine	EMD 710-16	9L32/40	6S50MC-C
Power	8,000 HP	12,000 HP	12,900 HP
Speed	11 knots	13 knots	15 knots
Fuel Con.	26 mt/day	34 mt/day	35 mt/day
Complement	9	12	21
Economic Life	20 yrs	25 yrs	25 yrs

# Vessel Comparison

	DH Conv.	Modern ATB	Tanker
LOA – Barge	546'/166m	570'/174m	-
LOA – Boat	137'/42m	154'/47m	-
LOA – Unit	627'/191m	670'/204m	600'/183m
DWT	30 kmt	46 kmt	46 kmt
Cubic Capacity	240 kb	330 kb	330 kb
Draft Full Load 8.3 bbls/mt	32'/9.8m	33'/10m	36'/11m
Load Line	33'/10m	40'/12.2m	40'/12.2m

# Benefits of the ATB

- Lower operating expenses
- Lower capital investment
- At similar drafts, barge capacity larger due to absence of engine room
- Articulated tug/barge connection keeps tug in notch in up to 25 foot seas virtually eliminating weather advantage of the tanker
- Tug (living spaces) can separate from barge in an emergency

## ATB Benefits – Lower Operating Expenses

- ATB has smaller crew complement
- ATB vessels can be maintained separately
- Daily Operating Expenses:
  - Traditional ATB ~ \$9,000/day
  - Modern ATB ~ \$12,000/day
  - Tanker ~ \$18,000/day

## ATB Benefits – Lower Capital Investment

- Barge design allows lower cost construction
- Smaller accommodation spaces
- Fewer systems
- Broadens market to mid-tier shipyards
- Building tug and barge separately allows efficient utilization of facilities
- Lower construction execution risk
- Competitive price with fewer vessels in series

# ATB Benefits – Capacity When Draft Limited

SW Draft (cargo density 8.3 bbls/mt)	Traditional ATB	Modern ATB	Tanker
32'/9.8m	240 kb	325 kb	275 kb
34'/10.4m	-	330 kb	299 kb
36'/11.0m	-	-	324 kb

- Competitive advantage for draft constrained ports
- Tampa – Many berths have 32' to 34' restrictions
- New York – Many Arthur Kill berths limited to 33' brackish

## Disadvantages of Traditional ATB

- Separate tug and barge results in less efficient hull form
- Traditional tug boats burn light fuel
- Traditional coupler doesn't allow changing barge drafts while tug and barge are connected

# Modern ATB Design Addresses Disadvantages

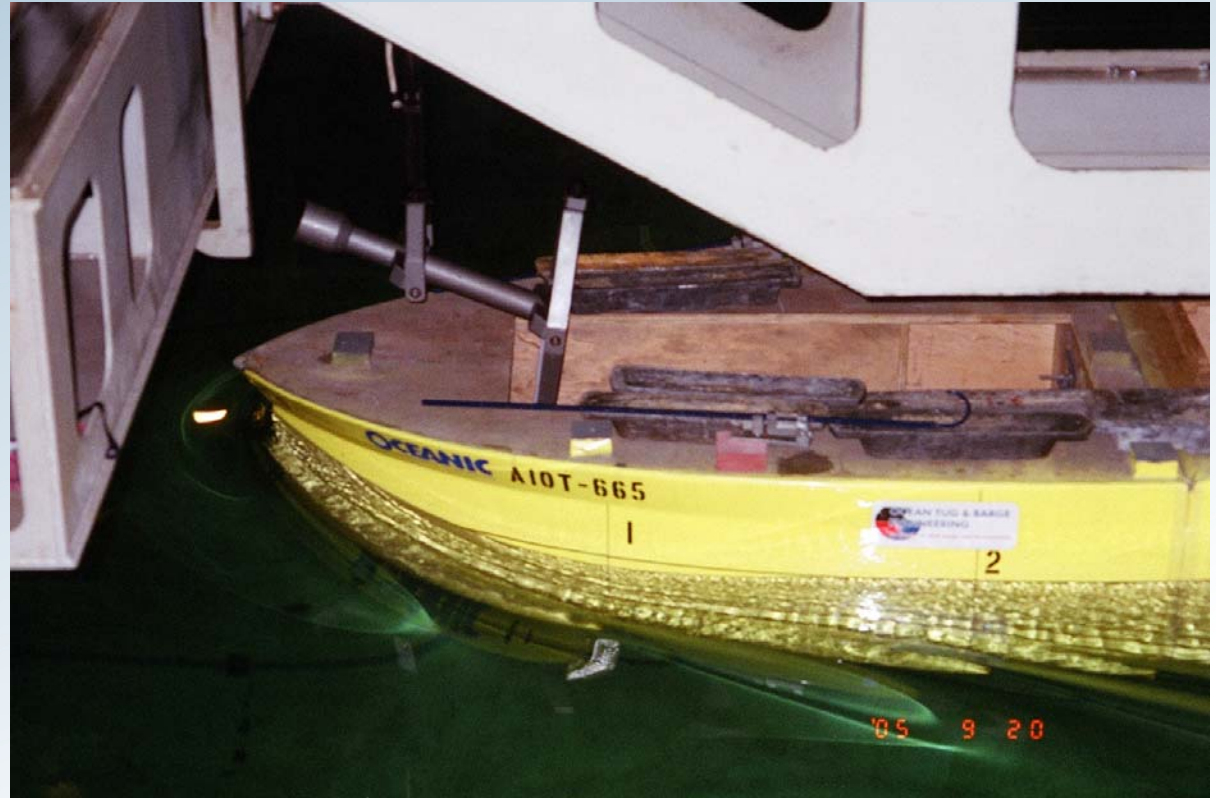

- Refined boat and hull forms using extensive model testing and computational fluid dynamics techniques
- Higher power, heavy fuel medium speed engines
- Refined coupling system allows draft changes for operations at offshore moorings or in lightering
- Barge equipped with Inert Gas System
- Tug built to SOLAS

# Tanker vs. Modern ATB - Speed

- Recent model testing predicts service speed of 13 knots for 12 khp boat
- Tug hull could accommodate up to 15 khp for predicted speeds approaching 14 knots

## Tanker vs. Modern ATB - Fuel

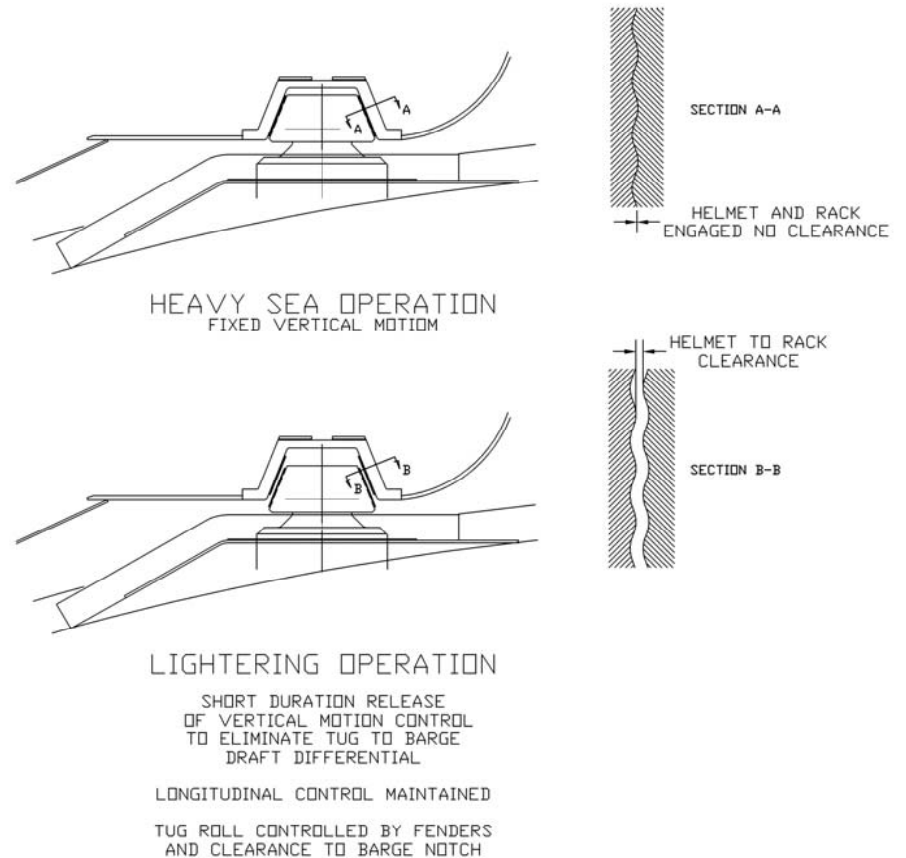

- Modern ATB design addresses many of the fuel advantages of tankers
- High efficiency (175 g/kw-hr) 4 stroke medium speed engines burn IFO-380
- Gensets burn diesel but shaft generators carry at sea loads

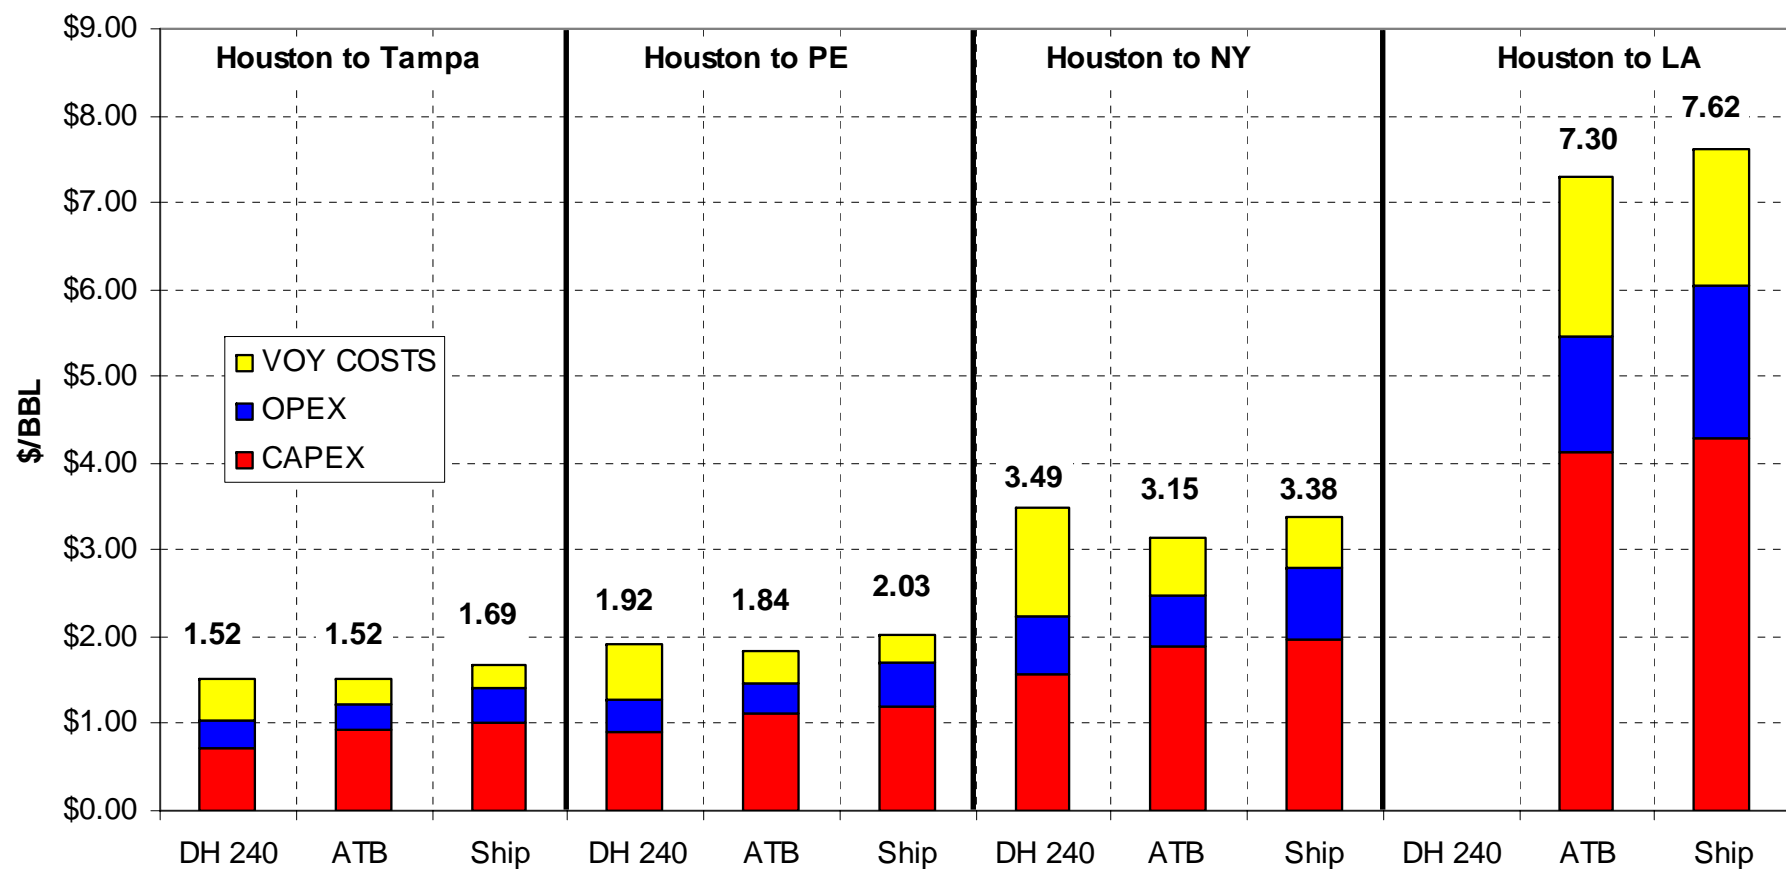

# Tanker vs. Modern ATB - Seakeeping

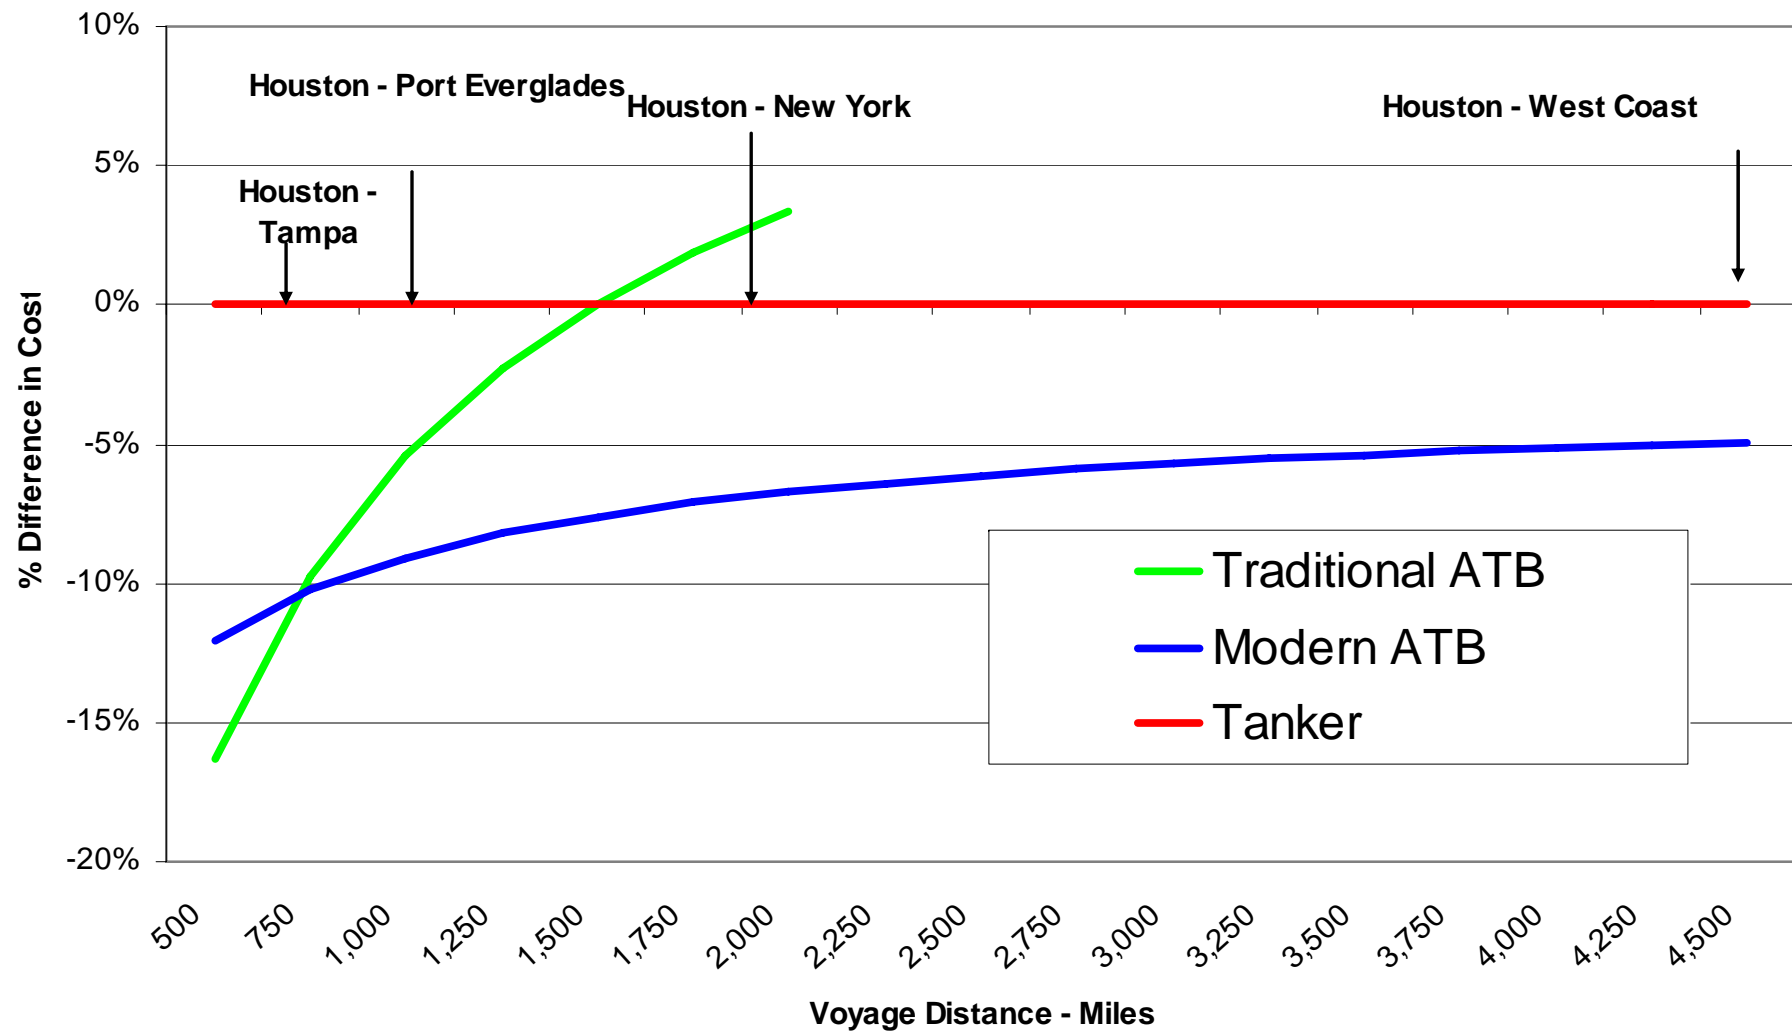

- Twin screw arrangement provides redundancy and improves maneuverability
- Intercon coupler provides at sea operating performance very similar to a tanker
- Smooth tooth waveform coupler allows tug and barge to stay coupled while barge changes draft allowing operations at offshore moorings

# Delivered Cost Comparison

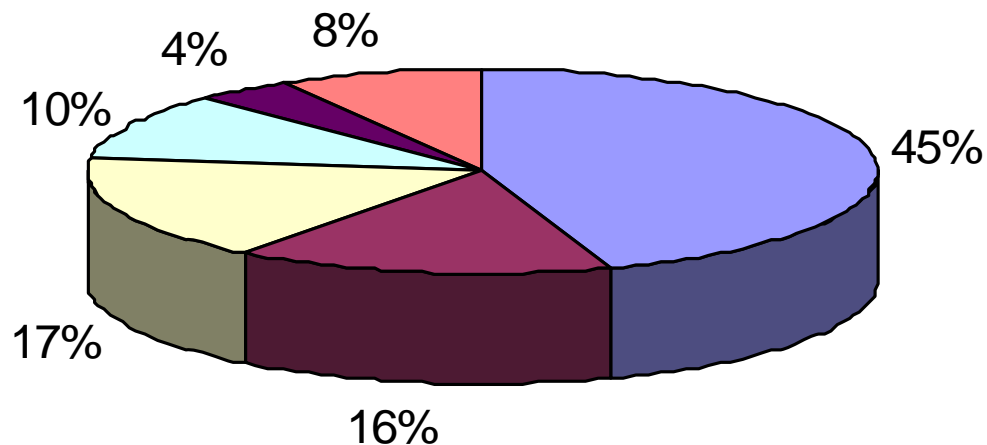

# Delivered Cost Difference

# Greatest ATB Advantage for Largest Market

**U.S. Petroleum  
Estimated Coastwise Shipping Demand**

 Gulf to Fla	 Gulf to SA & NE	 Intra West Coast
 Gulf to West Coast	 Lightering	 Other

# Conclusions

- Traditional ATB more economical than tankers in the short trades
- Modern ATB more economical than tankers in all Jones Act trades
- Lower operating expenses and capital costs offset speed differential
- Modern ATB connection systems virtually eliminate weather advantage of tanker
- Shipyards can provide competitive pricing with fewer vessels in series
