⁸² Ashwood, J. S. (2017 March) Direct-To-Consumer Telehealth May Increase Access To Care But Does Not Decrease Spending. *Health Affairs*.

additional Medicare spending in the first year and could eventually result in up to \$20 million in spending per year in future years. These estimates are uncertain and could change after further consideration of the potential variables and issues specific to these services.

3. Outpatient Therapy Services

As noted in section II.M. of this final rule, we are finalizing our proposal to end functional reporting for outpatient therapy services as part of our burden reduction efforts in response to the RFI on CMS Flexibilities and Efficiencies that was issued in the CY 2018 PFS proposed rule (82 FR 34172 through 34173). Under our functional reporting system therapy practitioners and providers are required to report, whenever functional reporting is required, non-payable HCPCS G-codes and modifiers – typically in pairs – to convey information about the beneficiary’s functional limitation category and functional status throughout the PT, OT, or SLP episode of care. In addition, each time functional reporting is required on the claim, the therapy provider must also document the functional reporting G-codes and their modifiers in the medical record. In this final rule, we are finalizing our proposal to eliminate this requirement that therapy practitioners and providers report HCPCS G-codes and modifiers or document in the medical record to convey functional reporting status for PT, OT or SLP episode of care.

To quantify the amount of burden reduction, we estimated the total amount of time that therapy practitioners spend doing functional reporting. To do this, we first looked at our data for CY 2017 for professional claims by the type of plan of care reported primarily by therapists in private practice (TPPs), including physical therapists, occupational therapists, and speech-language pathologists. We found that the overall utilization of the 42 functional reporting HCPCS G-codes totaled 15,456,421 single units, or 7,728,211 pairs.

We then considered the time, on average, it might take to report on the claim and document in the medical record each pair of HCPCS G-codes. We noted this includes the time it takes to make the initial determination of the HCPCS G-code functional limitation category, as well as the time needed to make each initial and/or subsequent assignments for the applicable severity modifiers in order to define the patient's functional status. We then made the assumption that it would take between 1 minute and 1.5 minutes, on average, to report the HCPCS G-code and modifier pair each time functional reporting is required. Using the total utilization of G-code pairs and the range of 1 minute to 1.5 minutes, we calculated that TPPs would have saved between 128,804 and 193,206 hours (or 7,728,211 to 11,592,317 minutes) collectively in CY 2017 if the functional reporting requirements had not been in place. We continue to believe this is a reasonable projection for the potential savings to TPPs, physicians and certain nonphysician practitioners in future years with the finalization of our proposal to end functional reporting effective January 1, 2019.

Because therapy services are also furnished by providers of outpatient therapy services such as hospitals, SNFs and rehabilitation agencies that submit institutional claims, typically representing a greater amount of expenditures than practitioners submitting professional claims, we calculated additional savings for these providers using the same time assumptions of 1 to 1.5 minutes to report the HCPCS G-code and modifier pair each time functional reporting is required. Our 2017 data showed a total utilization of the functional reporting HCPCS G-codes is 29,053,921 single units, or 14,526,961 pairs, indicating that therapy providers would collectively save between 242,116 to 363,174 hours (or 14,526,961 to 21,790,442 minutes) for CY 2017 if the functional reporting requirements had not been effective during that year.

As discussed in section II.M. of this final rule, we received many comments on our burden reduction proposal to eliminate our functional reporting requirements, and nearly all comments were supportive. We believe it is reasonable to estimate that in CY 2019 TPPs and other practitioners submitting professional claims and therapists working for providers submitting institutional claims will collectively save, at a minimum, the same number of collective hours we calculated they would save for CY 2017, as specified previously in this RIA, with dates of service on and after January 1, 2019.

4. Physician Supervision of Diagnostic Imaging Procedures

We believe that the changes to the physician supervision requirements for RAs furnishing diagnostic imaging procedures as described in section II.F. of this final rule will significantly reduce burden for physicians. While approximately 215,000 diagnostic imaging services per year are currently performed that require personal supervision, we are not able to determine the number of these services that are performed by an RA due to limitations in the claims data. As a result, we are not able to quantify the amount of time potentially saved by physicians and practitioners under the policy we are finalizing to require direct supervision of diagnostic imaging procedures done by RAs in cases where personal supervision would ordinarily be required. That said, stakeholders representing the practitioner community have indicated that changing the required supervision level for RAs will result in a redistribution of workload from radiologists to RAs, potentially resulting in improved practice efficiency and patient satisfaction. Stakeholders have stated that practitioners that utilize RAs have experienced improvements in practice efficiency, as use of RAs allows radiologists more time for professional services such as interpretation of images, and these practitioners cite greater flexibility that results in reduced wait times. Furthermore, stakeholders contend that the Medicare supervision requirements currently

create disincentives to use RAs, as practitioners cannot make full use of them for Medicare patients, and the change to the supervision requirement would allow RAs to be more fully utilized. For these reasons, we believe the change in supervision requirements we are finalizing for RAs will contribute to burden reduction for physicians and practitioners providing diagnostic imaging procedures for Medicare beneficiaries.

5. Beneficiary Liability

Many proposed policy changes could result in a change in beneficiary liability as it relates to coinsurance (which is 20 percent of the fee schedule amount, if applicable for the particular provision after the beneficiary has met the deductible). To illustrate this point, as shown in our public use file Impact on Payment for Selected Procedures available on the CMS website at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/>, the CY 2018 national payment amount in the nonfacility setting for CPT code 99203 (Office/outpatient visit, new) was \$109.80, which means that in CY 2018, a beneficiary would be responsible for 20 percent of this amount, or \$21.96. Based on this final rule, using the CY 2019 CF, the CY 2019 national payment amount in the nonfacility setting for CPT code 99203, as shown in the Impact on Payment for Selected Procedures public use file, is \$109.92, which means that, in CY 2019, the final beneficiary coinsurance for this service would be \$21.98.

J. Impact on Beneficiaries in the Quality Payment Program

There are several changes in this rule that would have an effect on beneficiaries. In general, we believe that many of these changes, including those intended to improve accuracy in payment through regular updates to the inputs used to calculate payments under the PFS, would have a positive impact and improve the quality and value of care provided to Medicare

beneficiaries. For example, several of the new proposed measures include patient-reported outcomes, which may be used to help patients make more informed decisions about treatment options. Patient-reported outcome measures provide information on a patient's health status from the patient's point of view and may also provide valuable insights on factors such as quality of life, functional status, and overall disease experience, which may not otherwise be available through routine clinical data collection. Patient-reported outcomes are factors frequently of interest to patients when making decisions about treatment.⁸³ Further, the proposed policy changes in the Promoting Interoperability performance category shifts the focus to the interoperable, seamless exchange of electronic information. With the requirement that program participants use 2015 Edition CEHRT, the interoperable exchange of patient health information should be easier because the certification criteria are designed to facilitate information exchange. In combination with the newly proposed Promoting Interoperability measure to receive and incorporate health information, beneficiaries should begin to experience improved care coordination and care transitions because clinicians have improved access to the beneficiaries' health information across the spectrum of care.

Impact on Other Health Care Programs and Providers

We estimate that CY 2019 Quality Payment Program will not have a significant economic effect on eligible clinicians and groups and believe that MIPS policies, along with increasing participation in APMs over time may succeed in improving quality and reducing costs. This may in turn result in beneficial effects on both patients and some clinicians, and we intend to continue focusing on clinician-driven, patient-centered care.

K. Estimating Regulatory Familiarization Costs

⁸³ Institute of Medicine. 2013. Delivering High-Quality Cancer Care: Charting a New Course for a System in Crisis. Washington, DC: The National Academies Press. <https://doi.org/10.17226/18359>.

If regulations impose administrative costs on private entities, such as the time needed to read and interpret this rule, we should estimate the cost associated with regulatory review. Due to the uncertainty involved with accurately quantifying the number of entities that will review the rule, we assume that the total number of unique commenters on last year's rule will be the number of reviewers of this rule. We acknowledge that this assumption may understate or overstate the costs of reviewing this rule. It is possible that not all commenters reviewed last year's rule in detail, and it is also possible that some reviewers chose not to comment on the rule. For these reasons we thought that the number of past commenters would be a fair estimate of the number of reviewers of this rule. We welcomed any comments on the approach in estimating the number of entities which will review this rule.

We also recognize that different types of entities are in many cases affected by mutually exclusive sections of this rule, and therefore for the purposes of our estimate we assume that each reviewer reads approximately 50 percent of the rule. We sought comments on this assumption.

Using the wage information from the BLS for medical and health service managers (Code 11-9111), we estimate that the cost of reviewing this rule is \$107.38 per hour, including overhead and fringe benefits https://www.bls.gov/oes/current/oes_nat.htm. Assuming an average reading speed, we estimate that it would take approximately 8.0 hours for the staff to review half of this rule. For each facility that reviews the rule, the estimated cost is \$859.04 (8.0 hours x \$107.38). Therefore, we estimated that the total cost of reviewing this regulation is \$5,105,275 (\$859.04 x 5,943 reviewers).

L. Accounting Statement

As required by OMB Circular A-4 (available at <http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf>), in Tables 106 and 107 (Accounting Statements), we have prepared an accounting statement. This estimate includes growth in incurred benefits from CY 2018 to CY 2019 based on the FY 2019 President’s Budget baseline.

TABLE 106: Accounting Statement: Classification of Estimated Expenditures

CATEGORY	TRANSFERS
CY 2019 Annualized Monetized Transfers	Estimated increase in expenditures of \$0.3 billion for PFS CF update.
From Whom To Whom?	Federal Government to physicians, other practitioners and providers and suppliers who receive payment under Medicare.

TABLE 107: Accounting Statement: Classification of Estimated Costs, Transfer, and Savings

CATEGORY	TRANSFER
CY 2019 Annualized Monetized Transfers of beneficiary cost coinsurance.	\$0.1 billion
From Whom to Whom?	Beneficiaries to Federal Government.

M. Conclusion

The analysis in the previous sections, together with the remainder of this preamble, provided an initial Regulatory Flexibility Analysis. The previous analysis, together with the preceding portion of this preamble, provides an RIA. In accordance with the provisions of Executive Order 12866, this regulation was reviewed by the Office of Management and Budget.

List of Subjects

42 CFR Part 405

Administrative practice and procedure, Diseases, Health facilities, Health professions, Medical devices, Medicare, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 410

Health facilities, Health professions, Kidney diseases, Laboratories, Medicare, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 411

Diseases, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 414

Administrative practice and procedure, Biologics, Drugs, Health facilities, Health professions, Kidney diseases, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 415

Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 425

Administrative practice and procedure, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 495

Administrative practice and procedure, Health facilities, Health maintenance organizations (HMO), Health professions, Health records, Medicaid, Medicare, Penalties, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, the Centers for Medicare & Medicaid Services amends 42 CFR chapter IV as set forth below:

PART 405—FEDERAL HEALTH INSURANCE FOR THE AGED AND DISABLED

1. The authority citation for part 405 is revised to read as follows:

Authority: 42 U.S.C. 405(a), 1302, 1320b-12, 1395x, 1395y(a), 1395ff, 1395hh, 1395kk, 1395rr, and 1395ww(k)) and 42 U.S.C. 263a.

2. Section 405.2401 is amended in paragraph (b) by—

- a. Revising the introductory text of the definition of “Federally qualified health center”;
- and
- b. Revising the definition of “Secretary”.

The revisions read as follows:

§ 405.2401 Scope and definitions.

* * * *

(b) * * *

Federally qualified health center (FQHC) means an entity that has entered into an agreement with CMS to meet Medicare program requirements under § 405.2434 and—

* * * *

Secretary means the Secretary of Health and Human Services or his or her delegate.

* * * *

3. Section 405.2462 is amended by revising paragraph (g) introductory text to read as follows:

§ 405.2462 Payment for RHC and FQHC services.

* * * *

(g) To receive payment, the RHC or FQHC must do all of the following:

* * * *

4. Section 405.2464 is amended by—

a. Revising paragraphs (a)(1), (b) heading, (b)(1), (c), and (d); and

b. Adding a new paragraph (e)

The revisions and additions read as follows:

§ 405.2464 Payment rate.

(a) * * *

(1) Except as specified in paragraphs (d) and (e) of this section, an RHC that is authorized to bill under the reasonable cost system is paid an all-inclusive rate that is determined by the MAC at the beginning of the cost reporting period.

* * * *

(b) *Payment rate for FQHCs that are authorized to bill under the prospective payment system.* (1) Except as specified in paragraphs (d) and (e) of this section, a per diem rate is calculated by CMS by dividing total FQHC costs by total FQHC daily encounters to establish an average per diem cost.

* * * *

(c) *Payment for care management services.* For chronic care management services furnished between January 1, 2016 and December 31, 2017, payment to RHCs and FQHCs is at the physician fee schedule national non-facility payment rate. For care management services furnished on or after January 1, 2018, payment to RHCs and FQHCs is at the rate set for each of the RHC and FQHC payment codes for care management services.

(d) *Payment for FQHCs that are authorized to bill as grandfathered tribal FQHCs.*

Grandfathered tribal FQHCs are paid at the outpatient per visit rate for Medicare as set annually by the Indian Health Service for each beneficiary visit for covered services. There are no adjustments to this rate.

(e) *Payment for communication technology-based and remote evaluation services.* For communication technology-based and remote evaluation services furnished on or after January 1, 2019, payment to RHCs and FQHCs is at the rate set for each of the RHC and FQHC payment codes for communication technology-based and remote evaluation services.

PART 410--SUPPLEMENTARY MEDICAL INSURANCE (SMI) BENEFITS

5. The authority citation for part 410 is revised to read as follows:

Authority: 42 U.S.C. 1302, 1395m, 1395hh, 1395rr, and 1395ddd.

6. Section 410.32 is amended by adding paragraph (b)(4) to read as follows:

§ 410.32 Diagnostic x-ray tests, diagnostic laboratory tests, and other diagnostic tests: Conditions.

* * * * *

(b) * * *

(4) *Supervision requirement for RRA or RPA.* Diagnostic tests that are performed by a registered radiologist assistant (RRA) who is certified and registered by the American Registry of Radiologic Technologists or a radiology practitioner assistant (RPA) who is certified by the Certification Board for Radiology Practitioner Assistants, and that would otherwise require a personal level of supervision as specified in paragraph (b)(3) of this section, may be furnished under a direct level of physician supervision to the extent permitted by state law and state scope of practice regulations.

* * * * *

§ 410.59 [Amended]

7. Section 410.59 is amended by removing paragraph (a)(4).

§ 410.60 [Amended]

8. Section 410.60 is amended by removing paragraph (a)(4).

9. Section 410.61 is amended by revising paragraph (c) to read as follows:

§ 410.61 Plan of treatment requirements for outpatient rehabilitation services.

* * * * *

(c) *Content of the plan.* The plan prescribes the type, amount, frequency, and duration of the physical therapy, occupational therapy, or speech-language pathology services to be furnished to the individual, and indicates the diagnosis and anticipated goals.

* * * * *

§ 410.62 [Amended]

10. Section 410.62 is amended by removing paragraph (a)(4).

11. Section 410.78 is amended by--

- a. Adding paragraphs (b)(3)(ix), (x), (xi), and (xii);
- b. Revising paragraph (b)(4) introductory text, and
- c. Adding paragraph (b)(4)(iv).

The additions and revision read as follows:

§ 410.78 Telehealth services.

* * * * *

(b) * * *

(3) * * *

(ix) A renal dialysis facility (only for purposes of the home dialysis monthly ESRD-related clinical assessment in section 1881(b)(3)(B) of the Act);

(x) The home of an individual (only for purposes of the home dialysis ESRD-related clinical assessment in section 1881(b)(3)(B) of the Act).

(xi) A mobile stroke unit (only for purposes of diagnosis, evaluation, or treatment of symptoms of an acute stroke provided in accordance with section 1834(m)(6) of the Act).

(xii) The home of an individual (only for purposes of treatment of a substance use disorder or a co-occurring mental health disorder, furnished on or after July 1, 2019, to an individual with a substance use disorder diagnosis.

(4) Except as provided in paragraph (b)(4)(iv) of this section, originating sites must be:

* * * * *

(iv) The geographic requirements specified in paragraph (b)(4) of this section do not apply to the following telehealth services:

(A) Home dialysis monthly ESRD-related clinical assessment services furnished on or after January 1, 2019, at an originating site described in paragraphs (b)(3)(vi), (ix) or (x) of this section, in accordance with section 1881(b)(3)(B) of the Act; and

(B) Services furnished on or after January 1, 2019, for purposes of diagnosis, evaluation, or treatment of symptoms of an acute stroke.

(C) Services furnished on or after July 1, 2019 to an individual with a substance use disorder diagnosis, for purposes of treatment of a substance use disorder or a co-occurring mental health disorder.

* * * * *

§ 410.105 [Amended]

12. Section 410.105 is amended—

- a. In paragraph (c)(1)(ii) by removing the phrase “that are consistent with the patient function reporting on the claims for services”; and
- b. By removing paragraph (d).

PART 411--EXCLUSIONS FROM MEDICARE AND LIMITATIONS ON MEDICARE PAYMENT

13. The authority citation for part 411 is revised to read as follows:

Authority: 42 U.S.C. 1302, 1395w-101 through 1395w-152, 1395hh, and 1395nn.

14. Section 411.353 is amended by—

- a. Revising paragraph (g)(1); and
- b. Removing and reserving paragraph (g)(2).

The revision reads as follows:

§ 411.353 Prohibition on certain referrals by physicians and limitations on billing.

* * * * *

(g) * * *

(1) An entity may submit a claim or bill and payment may be made to an entity that submits a claim or bill for a designated health service if —

(i) The compensation arrangement between the entity and the referring physician fully complies with an applicable exception in this subpart except with respect to the signature requirement of the exception; and

(ii) The parties obtain the required signature(s) within 90 consecutive calendar days immediately following the date on which the compensation arrangement became noncompliant

and the compensation arrangement otherwise complies with all criteria of the applicable exception.

(2) [Reserved]

15. Section 411.354 is amended by adding paragraph (e) to read as follows:

§ 411.354 Financial relationship, compensation, and ownership or investment interest.

* * * * *

(e) *Special rule on compensation arrangements—(1) Application.* This paragraph (e) applies only to compensation arrangements as defined in section 1877 of the Act and this subpart.

(2) *Writing requirement.* In the case of any requirement in this subpart for a compensation arrangement to be in writing, such requirement may be satisfied by a collection of documents, including contemporaneous documents evidencing the course of conduct between the parties.

PART 414—PAYMENT FOR PART B MEDICAL AND OTHER HEALTH SERVICES

16. The authority citation for part 414 is revised to read as follows:

Authority: 42 U.S.C. 1302, 1395hh, and 1395rr(b)(1).

17. Section 414.65 is amended by—

- a. Revising paragraph (a) introductory text;
- b. Removing paragraph (a)(1);
- c. Redesignating paragraphs (a)(2) and (3), as paragraphs (a)(1) and (2), respectively; and
- d. Adding paragraph (b)(3).

The revision and addition reads as follows:

§ 414.65 Payment for telehealth services.

(a) *Professional service.* The Medicare payment amount for telehealth services described under § 410.78 of this chapter is equal to the current fee schedule amount applicable for the service of the physician or practitioner, subject to paragraphs (a)(1) and (2) of this section, but must be made in accordance with the following limitations:

* * * * *

(b) * * *

(3) No originating site facility fee payment is made to an originating site described in § 410.78(b)(3)(x), (xi), or (xii); or to an originating site for services furnished under the exception at § 410.78(b)(4)(iv)(A) or (B) of this chapter.

* * * * *

18. Section 414.94 is amended--

- a. In paragraph (b), by revising the definition of “Applicable setting”; and
- b. By revising paragraphs (i)(3), (j), and (k) introductory text.

The revisions read as follows:

§ 414.94 Appropriate use criteria for advanced diagnostic imaging services.

* * * * *

(b) * * *

Applicable setting means a physician’s office, a hospital outpatient department (including an emergency department), an ambulatory surgical center, an independent diagnostic testing facility, and any other provider-led outpatient setting determined appropriate by the Secretary.

* * * * *

(i) * * *

(3) Significant hardships for ordering professionals who experience any of the following:

- (i) Insufficient internet access.
- (ii) EHR or CDSM vendor issues.
- (iii) Extreme and uncontrollable circumstances.

(j) *Consulting.* (1) Except as specified in paragraphs (i) and (j)(2) of this section, ordering professionals must consult specified applicable AUC through qualified CDSMs for applicable imaging services furnished in an applicable setting, paid for under an applicable payment system, and ordered on or after January 1, 2020.

(2) Ordering professionals may delegate the consultation with specified applicable AUC required under paragraph (j)(1) of this section to clinical staff acting under the direction of the ordering professional.

(k) *Reporting.* The following information must be reported on Medicare claims for advanced diagnostic imaging services furnished in an applicable setting, paid for under an applicable payment system defined in paragraph (b) of this section, and ordered on or after January 1, 2020:

* * * * *

19. Section 414.502 is amended in the definition of “Applicable laboratory” by adding paragraph (2)(i), adding and reserving paragraph (2)(ii), and revising paragraph (3) introductory text to read as follows:

§ 414.502 Definitions.

* * * * *

Applicable laboratory * * *

(2) * * *

(i) For hospital outreach laboratories--bills Medicare Part B on the CMS 1450 under bill type 14x;

(ii) [Reserved]

(3) In a data collection period, receives more than 50 percent of its Medicare revenues, which includes fee-for-service payments under Medicare Parts A and B, prescription drug payments under Medicare Part D, and any associated Medicare beneficiary deductible or coinsurance for services furnished during the data collection period from one or a combination of the following sources:

* * * * *

20. Section 414.610 is amended--

- a. In paragraphs (c)(1)(ii) introductory text and (c)(5)(ii) by removing the date “December 31, 2017” and adding in its place the date “December 31, 2022”; and
- b. By revising paragraph (c)(8).

The revision reads as follows:

§ 414.610 Basis of payment.

* * * * *

(c) * * *

(8) *Transport of an individual with end-stage renal disease for renal dialysis services.*

For ambulance services furnished during the period October 1, 2013 through September 30, 2018, consisting of non-emergency basic life support (BLS) services involving transport of an individual with end-stage renal disease for renal dialysis services (as described in section 1881(b)(14)(B) of the Act) furnished other than on an emergency basis by a provider of services or a renal dialysis facility, the fee schedule amount otherwise applicable (both base rate and

mileage) is reduced by 10 percent. For such services furnished on or after October 1, 2018, the fee schedule amount otherwise applicable (both base rate and mileage) is reduced by 23 percent.

* * * * *

§ 414.904 [Amended]

21. Section 414.904 is amended in paragraph (e)(4) by removing the phrase “acquisition cost or the applicable Medicare Part B drug payment” and adding in its place the phrase “acquisition cost or the Medicare Part B drug payment”.

22. Section 414.1305 is amended by—

- a. Revising the definition of “Ambulatory Surgical Center (ASC)-based MIPS eligible clinician”;
- b. Adding in alphabetical order definitions for “Collection type” and “Health IT vendor”;
- c. Revising the definitions of “High priority measure”, “Hospital-based MIPS eligible clinician”, and “Low-volume threshold”;
- d. Adding in alphabetical order a definition for “MIPS determination period”;
- e. Revising the definitions of “MIPS eligible clinician”, “Non-patient facing MIPS eligible clinician”, “Qualified Clinical Data Registry (QCDR)”, “Qualifying APM Participant (QP)”, and “Small practice”; and
- f. Adding in alphabetical order a definition for “Submission type”, “Submitter type”, and “Third party intermediary”.

The revisions and additions read as follows:

§ 414.1305 Definitions.

* * * * *

Ambulatory Surgical Center (ASC)-based MIPS eligible clinician means:

(1) For the 2019 and 2020 MIPS payment years, a MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service identified by the Place of Service (POS) codes used in the HIPAA standard transaction as an ambulatory surgical center setting based on claims for a period prior to the performance period as specified by CMS; and

(2) Beginning with the 2021 MIPS payment year, a MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service identified by the POS codes used in the HIPAA standard transaction as an ambulatory surgical center setting based on claims for the MIPS determination period.

* * * * *

Collection type means a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: electronic clinical quality measures (eCQMs); MIPS Clinical Quality Measures (MIPS CQMs), QCDR measures, Medicare Part B claims measures, CMS Web Interface measures, the CAHPS for MIPS survey, and administrative claims measures.

* * * * *

Health IT vendor means an entity that supports the health IT requirements on behalf of a MIPS eligible clinician (including obtaining data from a MIPS eligible clinician's CEHRT).

* * * * *

High priority measure means:

(1) For the 2019 and 2020 MIPS payment years, an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, or care coordination quality measure.

(2) Beginning with the 2021 MIPS payment year, an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure.

Hospital-based MIPS eligible clinician means:

(1) For the 2019 and 2020 MIPS payment years, a MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service identified by the Place of Service (POS) codes used in the HIPAA standard transaction as an inpatient hospital, on-campus outpatient hospital, off campus-outpatient hospital, or emergency room setting based on claims for a period prior to the performance period as specified by CMS; and

(2) Beginning with the 2021 MIPS payment year, a MIPS eligible clinician who furnishes 75 percent or more of his or her covered professional services in sites of service identified by the POS codes used in the HIPAA standard transaction as an inpatient hospital, on-campus outpatient hospital, off campus outpatient hospital, or emergency room setting based on claims for the MIPS determination period.

* * * * *

Low-volume threshold means:

(1) For the 2019 MIPS payment year, the low-volume threshold that applies to an individual eligible clinician, group, or APM Entity group that, during the low-volume threshold determination period described in paragraph (4) of this definition, has Medicare Part B allowed charges less than or equal to \$30,000 or provides care for 100 or fewer Medicare Part B-enrolled individuals.

(2) For the 2020 MIPS payment year, the low-volume threshold that applies to an individual eligible clinician, group, or APM Entity group that, during the low-volume threshold

determination period described in paragraph (4) of this definition, has allowed charges for covered professional services less than or equal to \$90,000 or furnishes covered professional services to 200 or fewer Medicare Part B-enrolled individuals.

(3) Beginning with the 2021 MIPS payment year, the low-volume threshold that applies to an individual eligible clinician, group, or APM Entity group that, during the MIPS determination period, has allowed charges for covered professional services less than or equal to \$90,000, furnishes covered professional services to 200 or fewer Medicare Part B-enrolled individuals, or furnishes 200 or fewer covered professional services to Medicare Part B-enrolled individuals.

(4) For the 2019 and 2020 MIPS payment years, the low-volume threshold determination period is a 24-month assessment period consisting of:

(i) An initial 12-month segment that spans from the last 4 months of the calendar year 2 years prior to the performance period through the first 8 months of the calendar year preceding to the performance period; and

(ii) A second 12-month segment that spans from the last 4 months of the calendar year 1 year prior to the performance period through the first 8 months of the calendar year performance period. An individual eligible clinician, group, or APM Entity group that is identified as not exceeding the low-volume threshold during the initial 12-month segment will continue to be excluded under § 414.1310(b)(1)(iii) for the applicable year regardless of the results of the second 12-month segment analysis. For the 2019 MIPS payment year, each segment of the low-volume threshold determination period includes a 60-day claims run out. For the 2020 MIPS payment year, each segment of the low-volume threshold determination period includes a 30-day claims run out.

* * * * *

MIPS determination period means:

- (1) Beginning with the 2021 MIPS payment year, a 24-month assessment period consisting of:
 - (i) An initial 12-month segment beginning on October 1 of the calendar year 2 years prior to the applicable performance period and ending on September 30 of the calendar year preceding the applicable performance period, and that includes a 30-day claims run out; and
 - (ii) A second 12-month segment beginning on October 1 of the calendar year preceding the applicable performance period and ending on September 30 of the calendar year in which the applicable performance period occurs.
- (2) Subject to § 414.1310(b)(1)(iii), an individual eligible clinician, group, or APM Entity group that is identified as not exceeding the low-volume threshold or as having special status during the first segment of the MIPS determination period will be identified as such for the applicable MIPS payment year regardless of the results of the second segment of the MIPS determination period. An individual eligible clinician, group, or APM Entity group for which the unique billing TIN and NPI combination is established during the second segment of the MIPS determination period will be assessed based solely on the results of such segment.

MIPS eligible clinician as identified by a unique billing TIN and NPI combination used to assess performance, means any of the following (except as excluded under § 414.1310(b)):

- (1) For the 2019 and 2020 MIPS payment years:
 - (i) A physician (as defined in section 1861(r) of the Act);
 - (ii) A physician assistant, a nurse practitioner, and clinical nurse specialist (as such terms are defined in section 1861(aa)(5) of the Act);

(iii) A certified registered nurse anesthetist (as defined in section 1861(bb)(2) of the Act); and

(iv) A group that includes such clinicians.

(2) For the 2021 MIPS payment year and future years:

(i) A clinician described in paragraph (1) of this definition;

(ii) A physical therapist or occupational therapist;

(iii) A qualified speech-language pathologist;

(iv) A qualified audiologist (as defined in section 1861(l)(3)(B) of the Act);

(v) A clinical psychologist (as defined by the Secretary for purposes of section 1861(ii) of the Act);

(vi) A registered dietician or nutrition professional; and

(vii) A group that includes such clinicians.

* * * * *

Non-patient facing MIPS eligible clinician means:

(1) For the 2019 and 2020 MIPS payment year, an individual MIPS eligible clinician who bills 100 or fewer patient facing encounters (including Medicare telehealth services defined in section 1834(m) of the Act), as described in paragraph (3) of this definition, during the non-patient facing determination period described in paragraph (4) of this definition, and a group or virtual group provided that more than 75 percent of the NPIs billing under the group's TIN or virtual group's TINs, as applicable, meet the definition of a non-patient facing individual MIPS eligible clinician.

(2) Beginning with the 2021 MIPS payment year, an individual MIPS eligible clinician who bills 100 or fewer patient facing encounters (including Medicare telehealth services defined

in section 1834(m) of the Act), as described in paragraph (3) of this definition, during the MIPS determination period, and a group or virtual group provided that more than 75 percent of the NPIs billing under the group's TIN or virtual group's TINs, as applicable, meet the definition of a non-patient facing individual MIPS eligible clinician.

(3) For purposes of this definition, a patient-facing encounter is an instance in which the individual MIPS eligible clinician or group bills for items and services furnished such as general office visits, outpatient visits, and procedure codes under the PFS, as specified by CMS.

(4) For the 2019 and 2020 MIPS payment year, the non-patient facing determination period is a 24-month assessment period consisting of:

(i) An initial 12-month segment that spans from the last 4 months of the calendar year 2 years prior to the performance period through the first 8 months of the calendar year preceding the performance period; and

(ii) A second 12-month segment that spans from the last 4 months of the calendar year 1 year prior to the performance period through the first 8 months of the calendar year performance period. An individual eligible MIPS clinician, group, or virtual group that is identified as non-patient facing during the initial 12-month segment will continue to be considered non-patient facing for the applicable year regardless of the results of the second 12-month segment analysis. For the 2019 MIPS payment year, each segment of the non-patient facing determination period includes a 60-day claims run out. For the 2020 MIPS payment year and future years, each segment of the non-patient facing determination period includes a 30-day claims run out.

* * * * *

Qualified clinical data registry (QCDR) means:

(1) For the 2019, 2020 and 2021 MIPS payment year, a CMS-approved entity that has self-nominated and successfully completed a qualification process to determine whether the entity may collect medical or clinical data for the purpose of patient and disease tracking to foster improvement in the quality of care provided to patients.

(2) Beginning with the 2022 MIPS payment year, an entity that demonstrates clinical expertise in medicine and quality measurement development experience and collects medical or clinical data on behalf of a MIPS eligible clinician for the purpose of patient and disease tracking to foster improvement in the quality of care provided to patients.

* * * * *

Qualifying APM participant (QP) means an eligible clinician determined by CMS to have met or exceeded the relevant QP payment amount or QP patient count threshold under § 414.1430(a)(1), (a)(3), (b)(1), or (b)(3) for a year based on participation in an APM Entity that is also participating in an Advanced APM.

* * * * *

Small practice means:

(1) For the 2019 MIPS payment year, a TIN consisting of 15 or fewer eligible clinicians.

(2) For the 2020 MIPS payment year, a TIN consisting of 15 or fewer eligible clinicians during a 12-month assessment period that spans from the last 4 months of the calendar year 2 years prior to the performance period through the first 8 months of the calendar year preceding the performance period and includes a 30-day claims run out.

(3) Beginning with the 2021 MIPS payment year, a TIN consisting of 15 or fewer eligible clinicians during the MIPS determination period.

* * * * *

Submission type means the mechanism by which the submitter type submits data to CMS, including, but not limited to: direct, log in and upload, log in and attest, Medicare Part B claims and the CMS Web Interface.

Submitter type means the MIPS eligible clinician, group, virtual group, or third party intermediary acting on behalf of a MIPS eligible clinician, group, or virtual group, as applicable, that submits data on measures and activities under MIPS.

Third party intermediary means an entity that has been approved under § 414.1400 to submit data on behalf of a MIPS eligible clinician, group, or virtual group for one or more of the quality, improvement activities, and promoting interoperability performance categories.

* * * * *

23. Section 414.1310 is amended by revising paragraphs (a), (b)(1)(ii), (iii), (d), (e)(1) and (2) to read as follows:

§ 414.1310 Applicability.

(a) *Program implementation.* Except as specified in paragraph (b) of this section, MIPS applies to payments for covered professional services furnished by MIPS eligible clinicians on or after January 1, 2019.

(b) * * *

(1) * * *

(ii) Is a Partial Qualifying APM Participant and does not elect to participate in MIPS as a MIPS eligible clinician; or

(iii) Does not exceed the low-volume threshold. Beginning with the 2021 MIPS payment year, if an individual eligible clinician, group, or APM Entity group in a MIPS APM exceeds at least one, but not all, of the low-volume threshold criteria and elects to participate in MIPS as a

MIPS eligible clinician, the individual eligible clinician, group, or APM Entity group is treated as a MIPS eligible clinician for the applicable MIPS payment year. For such solo practitioners and groups that elect to participate in MIPS as a virtual group (except for APM Entity groups in MIPS APMs), the virtual group election under § 414.1315 constitutes an election under this paragraph and results in the solo practitioners and groups being treated as MIPS eligible clinicians for the applicable MIPS payment year. For such APM Entity groups in MIPS APMs, only the APM Entity group election can result in the APM Entity group being treated as MIPS eligible clinicians for the applicable MIPS payment year.

* * * * *

(d) *Clarification.* In no case will a MIPS payment adjustment factor (or additional MIPS payment adjustment factor) apply to payments for items and services furnished during a year by a eligible clinician, including an eligible clinician described in paragraph (b) or (c) of this section, who is not a MIPS eligible clinician, including an eligible clinician who voluntarily reports on applicable measures and activities under MIPS.

(e) * * *

(1) Except as provided under § 414.1370(f)(2), each MIPS eligible clinician in the group will receive a MIPS payment adjustment factor (or additional MIPS payment adjustment factor) based on the group's combined performance assessment.

(2) For individual MIPS eligible clinicians to participate in MIPS as a group, all of the following requirements must be met:

(i) Groups must meet the definition of a group at all times during the applicable performance period.

(ii) Individual eligible clinicians that elect to participate in MIPS as a group must

aggregate their performance data across the group's TIN.

(iii) Individual eligible clinicians that elect to participate in MIPS as a group will have their performance assessed at the group level across all four MIPS performance categories.

(iv) Groups must adhere to an election process established by CMS, as applicable.

* * * * *

24. Section 414.1315 is revised to read as follows:

§ 414.1315 Virtual groups.

(a) *Eligibility.* (1) For a MIPS payment year, a solo practitioner or a group of 10 or fewer eligible clinicians may elect to participate in MIPS as a virtual group with at least one other such solo practitioner or group. The election must be made prior to the start of the applicable performance period and cannot be changed during the performance period. A solo practitioner or group may elect to be in no more than one virtual group for a performance period, and, in the case of a group, the election applies to all MIPS eligible clinicians in the group.

(2) Except as provided under § 414.1370(f)(2), each MIPS eligible clinician in the virtual group receives a MIPS payment adjustment factor and, if applicable, an additional MIPS payment adjustment factor based on the virtual group's combined performance assessment.

(b) *Election deadline.* The election deadline is December 31 of the calendar year preceding the applicable performance period.

(c) *Election process.* For the 2020 MIPS payment year and future years, the virtual group election process is as follows:

(1) *Stage 1: Virtual group eligibility determination.* (i) For the 2020 MIPS payment year, the virtual group eligibility determination period is an assessment period of up to 5 months

beginning on July 1 and ending as late as November 30 of the calendar year preceding the applicable performance period, and that includes a 30-day claims run out.

(ii) Beginning with the 2021 MIPS payment year, the virtual group eligibility determination period is the first segment of the MIPS determination period.

(2) *Stage 2: Virtual group formation.* (i) Solo practitioners and groups that elect to participate in MIPS as a virtual group must establish a formal written agreement that satisfies paragraph (c)(3) of this section prior to the election.

(ii) A designated virtual group representative must submit an election, on behalf of the solo practitioners and groups that compose a virtual group, to participate in MIPS as a virtual group for a performance period in a form and manner specified by CMS by the election deadline specified in paragraph (b) of this section. The virtual group election must include each TIN and NPI associated with the virtual group and contact information for the virtual group representative.

(iii) After an election is made, the virtual group representative must contact their designated CMS contact to update any election information that changed during a performance period at least one time prior to the start of data submission.

(3) *Virtual group agreement.* The virtual group arrangement must be set forth in a formal written agreement among the parties, consisting of each solo practitioner and group that composes a virtual group. The agreement must comply with the following requirements:

(i) Identifies each party by name, TIN, and each NPI under the TIN, and includes as parties only the solo practitioners and groups that compose the virtual group.

(ii) Is for a term of at least one performance period.

(iii) Requires each party to notify each NPI under the party's TIN regarding their participation in the MIPS as a virtual group.

(iv) Sets forth each NPI's rights and obligations in, and representation by, the virtual group, including, but not limited to, the reporting requirements and how participation in the MIPS as a virtual group affects the NPI's ability to participate in the MIPS outside of the virtual group.

(v) Describes how the opportunity to receive payment adjustments will encourage each member of the virtual group (and each NPI under each TIN in the virtual group) to adhere to quality assurance and improvement.

(vi) Requires each party to update its Medicare enrollment information, including the addition or removal of NPIs billing under its TIN, on a timely basis in accordance with Medicare program requirements and to notify the other parties of any such changes within 30 days of the change.

(vii) Requires completion of a close-out process upon termination or expiration of the agreement that requires each party to furnish all data necessary for the parties to aggregate their data across the virtual group's TINs.

(viii) Expressly requires each party to participate in the MIPS as a virtual group and comply with the requirements of the MIPS and all other applicable laws (including, but not limited to, Federal criminal law, the Federal False Claims Act, the Federal anti-kickback statute, the Federal civil monetary penalties law, the Federal physician self-referral law, and the Health Insurance Portability and Accountability Act of 1996).

(ix) Is executed on behalf of each party by an individual who is authorized to bind the party.

(d) *Virtual group reporting requirements.* For solo practitioners and groups of 10 or fewer eligible clinicians to participate in MIPS as a virtual group, all of the following requirements must be met:

(1) Virtual groups must meet the definition of a virtual group at all times during the applicable performance period.

(2) Solo practitioners and groups of 10 or fewer eligible clinicians that elect to participate in MIPS as a virtual group must aggregate their performance data across the virtual group's TINs.

(3) Solo practitioners and groups of 10 or fewer eligible clinicians that elect to participate in MIPS as a virtual group will have their performance assessed at the virtual group level across all four MIPS performance categories.

(4) Virtual groups must adhere to the election process described in paragraph (c) of this section.

25. Section 414.1320 is amended by revising paragraphs (b)(2) and (c)(2) and adding paragraphs (d) and (e) to read as follows:

§ 414.1320 MIPS performance period.

* * * * *

(b) * * *

(2) Promoting Interoperability and improvement activities performance categories is a minimum of a continuous 90-day period within CY 2018, up to and including the full CY 2018 (January 1, 2018 through December 31, 2018).

(c) * * *

(2) Promoting Interoperability and improvement activities performance categories is a minimum of a continuous 90-day period within CY 2019, up to and including the full CY 2019 (January 1, 2019 through December 31, 2019).

(d) Beginning with the 2022 MIPS payment year, the performance period for:

(1) The quality and cost performance categories is the full calendar year (January 1 through December 31) that occurs 2 years prior to the applicable MIPS payment year.

(2) The improvement activities performance categories is a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year.

(e) For purposes of the 2022 MIPS payment year, the performance period for:

(1) The Promoting Interoperability performance category is a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year.

(2) [Reserved]

26. Section 414.1325 is revised to read as follows:

§ 414.1325 Data submission requirements.

(a) *Applicable performance categories.* (1) Except as provided in paragraph (a)(2) of this section or under § 414.1370, as applicable, individual MIPS eligible clinicians and groups must submit data on measures and activities for the quality, improvement activities, and Promoting Interoperability performance categories in accordance with this section. Except for the Medicare Part B claims submission type, the data may also be submitted on behalf of the individual MIPS eligible clinician or group by a third party intermediary described at § 414.1400.

(2) There are no data submission requirements for:

- (i) The cost performance category or administrative claims-based quality measures.

Performance in the cost performance category and on such measures is calculated by CMS using administrative claims data, which includes claims submitted with dates of service during the applicable performance period that are processed no later than 60 days following the close of the applicable performance period.

- (ii) The quality and cost performance categories, as applicable, for MIPS eligible clinicians and groups that are scored under the facility-based measurement scoring methodology described in § 414.1380(e).

(b) *Data submission types for individual MIPS eligible clinicians.* An individual MIPS eligible clinician may submit their MIPS data using:

- (1) For the quality performance category, the direct, login and upload, and Medicare Part B claims (beginning with the 2021 MIPS payment year for small practices only) submission types.

- (2) For the improvement activities or Promoting Interoperability performance categories, the direct, login and upload, or login and attest submission types.

(c) *Data submission types for groups.* Groups may submit their MIPS data using:

- (1) For the quality performance category, the direct, login and upload, Medicare Part B claims (beginning with the 2021 MIPS payment year, for small practices only), and CMS Web Interface (for groups consisting of 25 or more eligible clinicians or a third party intermediary submitting on behalf of a group) submission types.

- (2) For the improvement activities or Promoting Interoperability performance categories, the direct, login and upload, or login and attest submission types.

(d) *Use of multiple data submission types.* Beginning with the 2021 MIPS payment year, MIPS eligible clinicians, groups, and virtual groups may submit their MIPS data using multiple data submission types for any performance category described in paragraph (a)(1) of this section, as applicable; provided, however, that the MIPS eligible clinician, group, or virtual group uses the same identifier for all performance categories and all data submissions.

(e) *Data submission deadlines.* The data submission deadlines are as follows:

(1) For the direct, login and upload, login and attest, and CMS Web Interface submission types, March 31 following the close of the applicable performance period or a later date as specified by CMS.

(2) For the Medicare Part B claims submission type, data must be submitted on claims with dates of service during the applicable performance period that must be processed no later than 60 days following the close of the applicable performance period.

27. Section 414.1330 is revised to read as follows:

§ 414.1330 Quality performance category.

(a) For a MIPS payment year, CMS uses the following quality measures, as applicable, to assess performance in the quality performance category:

(1) Measures included in the MIPS final list of quality measures established by CMS through rulemaking;

(2) QCDR measures approved by CMS under § 414.1400;

(3) Facility-based measures described in § 414.1380; and

(4) MIPS APM measures described in § 414.1370.

(b) Unless a different scoring weight is assigned by CMS, performance in the quality performance category comprises:

(1) 60 percent of a MIPS eligible clinician's final score for MIPS payment year 2019.

(2) 50 percent of a MIPS eligible clinician's final score for MIPS payment year 2020.

(3) 45 percent of a MIPS eligible clinician's final score for MIPS payment year 2021.

28. Section 414.1335 is amended by revising paragraphs (a)(1) through (3) to read as follows:

§ 414.1335 Data submission criteria for the quality performance category.

(a) * * *

(1) *For Medicare Part B claims measures, MIPS CQMs, eCQMs, or QCDR measures.* (i)

Except as provided in paragraph (a)(1)(ii) of this section, submit data on at least six measures, including at least one outcome measure. If an applicable outcome measure is not available, report one other high priority measure. If fewer than six measures apply to the MIPS eligible clinician or group, report on each measure that is applicable.

(ii) MIPS eligible clinicians and groups that report on a specialty or subspecialty measure set, as designated in the MIPS final list of quality measures established by CMS through rulemaking, must submit data on at least six measures within that set, including at least one outcome measure. If an applicable outcome measure is not available, report one other high priority measure. If the set contains fewer than six measures or if fewer than six measures within the set apply to the MIPS eligible clinician or group, report on each measure that is applicable.

(2) *For CMS Web Interface measures.* (i) Report on all measures included in the CMS Web Interface. The group is required to report on at least one measure for which there is Medicare patient data.

(ii) [Reserved]

(3) *For the CAHPS for MIPS survey.* (i) For the 12-month performance period, a group that wishes to voluntarily elect to participate in the CAHPS for MIPS survey must use a survey vendor that is approved by CMS for the applicable performance period to transmit survey measures data to CMS.

(ii) [Reserved]

* * * * *

29. Section 414.1340 is amended by revising paragraphs (a) introductory text, (b) introductory text, and (c) to read as follows:

§ 414.1340 Data completeness criteria for the quality performance category.

(a) MIPS eligible clinicians and groups submitting quality measures data on QCDR measures, MIPS CQMs, or eCQMs must submit data on:

* * * * *

(b) MIPS eligible clinicians and groups submitting quality measure data on Medicare Part B claims measures must submit data on:

* * * * *

(c) Groups submitting quality measures data on CMS Web Interface measures or the CAHPS for MIPS survey must submit data on the sample of the Medicare Part B patients CMS provides, as applicable.

(1) *For CMS Web Interface measures.* (i) The group must report on the first 248 consecutively ranked beneficiaries in the sample for each measure or module. If the sample of eligible assigned beneficiaries is less than 248, then the group must report on 100 percent of assigned beneficiaries.

(ii) [Reserved]

(2) [Reserved]

30. Section 414.1350 is revised to read as follows:

§ 414.1350 Cost performance category.

(a) *Specification of cost measures.* For purposes of assessing performance of MIPS eligible clinicians on the cost performance category, CMS specifies cost measures for a performance period.

(b) *Attribution.* (1) Cost measures are attributed at the TIN/NPI level.

(2) For the total per capita cost measure, beneficiaries are attributed using a method generally consistent with the method of assignment of beneficiaries under § 425.402 of this chapter.

(3) For the Medicare Spending per Beneficiary (MSPB) measure, an episode is attributed to the MIPS eligible clinician who submitted the plurality of claims (as measured by allowed charges) for Medicare Part B services rendered during an inpatient hospitalization that is an index admission for the MSPB measure during the applicable performance period.

(4) For the acute condition episode-based measures specified for the 2017 performance period, an episode is attributed to each MIPS eligible clinician who bills at least 30 percent of inpatient evaluation and management (E&M) visits during the trigger event for the episode.

(5) For the procedural episode-based measures specified for the 2017 performance period, an episode is attributed to each MIPS eligible clinician who bills a Medicare Part B claim with a trigger code during the trigger event for the episode.

(6) For the acute inpatient medical condition episode-based measures specified beginning with the 2019 performance period, an episode is attributed to each MIPS eligible clinician who

bills inpatient E&M claim lines during a trigger inpatient hospitalization under a TIN that renders at least 30 percent of the inpatient E&M claim lines in that hospitalization.

(7) For the procedural episode-based measures specified beginning with the 2019 performance period, an episode is attributed to each MIPS eligible clinician who renders a trigger service as identified by HCPCS/CPT procedure codes.

(c) *Case minimums.* (1) For the total per capita cost measure, the case minimum is 20.

(2) For the Medicare spending per beneficiary measure, the case minimum is 35.

(3) For the episode-based measures specified for the 2017 performance period, the case minimum is 20.

(4) For the procedural episode-based measures specified beginning with the 2019 performance period, the case minimum is 10.

(5) For the acute inpatient medical condition episode-based measures specified beginning with the 2019 performance period, the case minimum is 20.

(d) *Scoring weight.* Unless a different scoring weight is assigned by CMS under section 1848(q)(5)(F) of the Act, performance in the cost performance category comprises:

(1) Zero percent of a MIPS eligible clinician's final score for MIPS payment year 2019.

(2) 10 percent of a MIPS eligible clinician's final score for MIPS payment year 2020.

(3) 15 percent of a MIPS eligible clinician's final score for MIPS payment year 2021.

31. Section 414.1355 is amended by revising paragraphs (a), (b) introductory text, and (c) to read as follows:

§ 414.1355 Improvement activities performance category.

(a) For a MIPS payment year, CMS uses improvement activities included in the MIPS final inventory of improvement activities established by CMS through rulemaking to assess performance in the improvement activities performance category.

(b) Unless a different scoring weight is assigned by CMS under section 1848(q)(5)(F) of the Act, performance in the improvement activities performance category comprises:

* * * * *

(c) The following are the list of subcategories, of which, with the exception of Participation in an APM, include activities for selection by a MIPS eligible clinician or group:

(1) Expanded practice access, such as same day appointments for urgent needs and after-hours access to clinician advice.

(2) Population management, such as monitoring health conditions of individuals to provide timely health care interventions or participation in a QCDR.

(3) Care coordination, such as timely communication of test results, timely exchange of clinical information to patients or other clinicians, and use of remote monitoring or telehealth.

(4) Beneficiary engagement, such as the establishment of care plans for individuals with complex care needs, beneficiary self-management assessment and training, and using shared decision making mechanisms.

(5) Patient safety and practice assessment, such as through the use of clinical or surgical checklists and practice assessments related to maintaining certification.

(6) Participation in an APM.

(7) Achieving health equity, such as for MIPS eligible clinicians that achieve high quality for underserved populations, including persons with behavioral health conditions, racial and

ethnic minorities, sexual and gender minorities, people with disabilities, people living in rural areas, and people in geographic HPSAs.

(8) Emergency preparedness and response, such as measuring MIPS eligible clinician participation in the Medical Reserve Corps, measuring registration in the Emergency System for Advance Registration of Volunteer Health Professionals, measuring relevant reserve and active duty uniformed services MIPS eligible clinician activities, and measuring MIPS eligible clinician volunteer participation in domestic or international humanitarian medical relief work.

(9) Integrated behavioral and mental health, such as measuring or evaluating such practices as: co-location of behavioral health and primary care services; shared/integrated behavioral health and primary care records; cross training of MIPS eligible clinicians, and integrating behavioral health with primary care to address substance use disorders or other behavioral health conditions, as well as integrating mental health with primary care.

32. Section 414.1360 is amended by revising paragraph (a)(1) to read as follows:

§ 414.1360 Data submission criteria for the improvement activities performance category.

(a) * * *

(1) *Via direct, login and upload, and login and attest.* For the applicable performance period, submit a yes response for each improvement activity that is performed for at least a continuous 90-day period during the applicable performance period.

* * * * *

§ 414.1365 [Removed]

33. Section 414.1365 is removed.

34. Section 414.1370 is amended by revising paragraphs (b)(3), (f)(2), (g)(4), (h)(4) introductory heading, (h)(5)(i)(A) and (B), and (h)(5)(ii) introductory text.

The revisions read as follows:

§ 414.1370 APM scoring standard under MIPS.

* * * *

(b)* * *

(3) The APM bases payment on quality measures and cost/utilization; and

* * * *

(f) * * *

(2) MIPS eligible clinicians who participate in a group or have elected to participate in a virtual group and who are also on a MIPS APM Participation List will be included in the assessment under MIPS for purposes of producing a group or virtual group score and under the APM scoring standard for purposes of producing an APM Entity score. The MIPS payment adjustment for these eligible clinicians is based solely on their APM Entity score; if the APM Entity group is exempt from MIPS all eligible clinicians within that APM Entity group are also exempt from MIPS.

(g) * * *

(4) *Promoting Interoperability*. (i) For the 2019 and 2020 MIPS payment years, each Shared Savings Program ACO participant TIN must report data on the Promoting Interoperability performance category separately from the ACO, as specified in § 414.1375(b)(2). The ACO participant TIN scores are weighted according to the number of MIPS eligible clinicians in each TIN as a proportion of the total number of MIPS eligible clinicians in the APM Entity group, and then aggregated to determine an APM Entity score for the ACI performance category.

(ii) For the 2019 and 2020 MIPS payment years, for APM Entities in MIPS APMs other

than the Shared Savings Program, CMS uses one score for each MIPS eligible clinician in the APM Entity group to derive a single average APM Entity score for the Promoting Interoperability performance category. Beginning with the 2021 MIPS payment year, for APM Entities in MIPS APMs including the Shared Savings Program, CMS uses one score for each MIPS eligible clinician in the APM Entity group to derive a single average APM Entity score for the Promoting Interoperability performance category. The score for each MIPS eligible clinician is the higher of either:

(A) A group score based on the measure data for the Promoting Interoperability performance category reported by a TIN for the MIPS eligible clinician according to MIPS submission and reporting requirements for groups; or

(B) An individual score based on the measure data for the Promoting Interoperability performance category reported by the MIPS eligible clinician according to MIPS submission and reporting requirements for individuals.

(iii) In the event that a MIPS eligible clinician participating in a MIPS APM receives an exception from the Promoting Interoperability performance category reporting requirements, such eligible clinician will be assigned a null score when CMS calculates the APM Entity's Promoting Interoperability performance category score under the APM scoring standard.

(A) If all MIPS eligible clinicians in an APM Entity have been excepted from reporting the Promoting Interoperability performance category, the performance category weight will be reweighted to zero for the APM Entity for that MIPS performance period.

(B) [Reserved]

(h) * * *

(4) *Promoting Interoperability.* * * *

(5) * * *

(i) * * *

(A) In 2017, the improvement activities performance category is reweighted to 25 percent and the Promoting Interoperability performance category is reweighted to 75 percent; and

(B) Beginning in 2018, the Promoting Interoperability performance category is reweighted to 75 percent and the improvement activities performance category is reweighted to 25 percent.

(ii) If CMS reweights the Promoting Interoperability performance category to zero percent:

* * * * *

35. Section 414.1375 is amended by revising the section heading, paragraphs (a), (b) introductory text, and (b)(2) to read as follows:

§ 414.1375 Promoting Interoperability (PI) performance category.

(a) *Final score.* Unless a different scoring weight is assigned by CMS under sections 1848(o)(2)(D), 1848(q)(5)(E)(ii), or 1848(q)(5)(F) of the Act, performance in the Promoting Interoperability performance category comprises 25 percent of a MIPS eligible clinician's final score for each MIPS payment year.

(b) *Reporting for the Promoting Interoperability performance category.* To earn a performance category score for the Promoting Interoperability performance category for inclusion in the final score, a MIPS eligible clinician must:

* * * * *

(2) *Report MIPS – Promoting Interoperability objectives and measures.* Report on the objectives and associated measures as specified by CMS for the Promoting Interoperability

performance category for the performance period as follows:

(i) For the 2019 and 2020 MIPS payment years: for each base score measure, as applicable, report the numerator (of at least one) and denominator, or yes/no statement, or claim an exclusion for each measure that includes an option for an exclusion; and

(ii) For the 2021 and 2022 MIPS payment years:

(A) Report that the MIPS eligible clinician completed the actions included in the Security Risk Analysis measure during the year in which the performance period occurs; and

(B) For each required measure, as applicable, report the numerator (of at least one) and denominator, or yes/no statement, or an exclusion for each measure that includes an option for an exclusion.

* * * * *

36. Section 414.1380 is revised to read as follows:

§ 414.1380 Scoring.

(a) *General.* MIPS eligible clinicians are scored under MIPS based on their performance on measures and activities in four performance categories. MIPS eligible clinicians are scored against performance standards for each performance category and receive a final score, composed of their performance category scores, and calculated according to the final score methodology.

(1) *Performance standards.* (i) For the quality performance category, measures are scored between zero and 10 measure achievement points. Performance is measured against benchmarks. Measure bonus points are available for submitting high-priority measures, submitting measures using end-to-end electronic reporting, and in small practices that submit data on at least 1 quality

measure. Beginning with the 2020 MIPS payment year, improvement scoring is available in the quality performance category.

(ii) For the cost performance category, measures are scored between 1 and 10 points. Performance is measured against a benchmark. Starting with the 2024 MIPS payment year, improvement scoring is available in the cost performance category.

(iii) For the improvement activities performance category, each improvement activity is assigned a certain number of points. The points for all submitted activities are summed and scored against a total potential performance category score of 40 points.

(iv) For the Promoting Interoperability performance category, each measure is scored against a maximum number of points. The points for all submitted measures are summed and scored against a total potential performance category score of 100 points.

(2) [Reserved]

(b) *Performance categories.* MIPS eligible clinicians are scored under MIPS in four performance categories.

(1) *Quality performance category.* (i) *Measure achievement points.* For the 2019, 2020, and 2021 MIPS payment years, MIPS eligible clinicians receive between 3 and 10 measure achievement points (including partial points) for each measure required under § 414.1335 on which data is submitted in accordance with § 414.1325 that has a benchmark at paragraph (b)(1)(ii) of this section, meets the case minimum requirement at paragraph (b)(1)(iii) of this section, and meets the data completeness requirement at § 414.1340. The number of measure achievement points received for each such measure is determined based on the applicable benchmark decile category and the percentile distribution. MIPS eligible clinicians receive zero measure achievement points for each measure required under § 414.1335 on which no data is

submitted in accordance with § 414.1325. MIPS eligible clinicians that submit data in accordance with § 414.1325 on a greater number of measures than required under § 414.1335 are scored only on the required measures with the greatest number of measure achievement points. Beginning with the 2021 MIPS payment year, MIPS eligible clinicians that submit data in accordance with § 414.1325 on a single measure via multiple collection types are scored only on the data submission with the greatest number of measure achievement points.

(A) *Lack of benchmark or case minimum.* (1) Except as provided in paragraph (b)(1)(i)(A)(2) of this section, for the 2019, 2020, and 2021 MIPS payment years, MIPS eligible clinicians receive 3 measure achievement points for each submitted measure that meets the data completeness requirement, but does not have a benchmark or meet the case minimum requirement.

(2) The following measures are excluded from a MIPS eligible clinician's total measure achievement points and total available measure achievement points:

(i) Each submitted CMS Web Interface-based measure that meets the data completeness requirement, but does not have a benchmark or meet the case minimum requirement, or is redesignated as pay-for-reporting for all Shared Savings Program accountable care organizations by the Shared Savings Program; and

(ii) Each administrative claims-based measure that does not have a benchmark or meet the case minimum requirement.

(B) *Lack of complete data.* (1) Except as provided in paragraph (b)(1)(i)(B)(2) of this section, for each submitted measure that does not meet the data completeness requirement:

(i) For the 2019 MIPS payment year, MIPS eligible clinicians receive 3 measure achievement points;

(ii) For the 2020 and 2021 MIPS payment years, MIPS eligible clinicians other than small practices receive 1 measure achievement point, and small practices receive 3 measure achievement points; and

(iii) Beginning with the 2022 MIPS payment year, MIPS eligible clinicians other than small practices receive zero measure achievement points, and small practices receive 3 measure achievement points.

(2) MIPS eligible clinicians receive zero measure achievement points for each submitted CMS Web Interface-based measure that does not meet the data completeness requirement.

(ii) *Benchmarks.* Benchmarks will be based on collection type, from all available sources, including MIPS eligible clinicians and APMs, to the extent feasible, during the applicable baseline or performance period.

(A) Each benchmark must have a minimum of 20 individual clinicians or groups who reported the measure meeting the case minimum requirement at paragraph (b)(1)(iii) of this section and the data completeness requirement at § 414.1340 and having a performance rate that is greater than zero.

(B) CMS Web Interface collection type uses benchmarks from the corresponding reporting year of the Shared Savings Program.

(iii) *Minimum case requirements.* Except for the all-cause hospital readmission measure, the minimum case requirement is 20 cases. For the all-cause hospital readmission measure, the minimum case requirement is 200 cases.

(iv) *Topped out measures.* CMS will identify topped out measures in the benchmarks published for each Quality Payment Program year.

(A) For the 2020 MIPS payment year, each topped out measure specified by CMS

through rulemaking receives no more than 7 measure achievement points, provided that the benchmark for the applicable collection type is identified as topped out in the benchmarks published for the 2018 MIPS performance period.

(B) Beginning with the 2021 MIPS payment year, each measure (except for measures in the CMS Web Interface) for which the benchmark for the applicable collection type is identified as topped out for 2 or more consecutive years receives no more than 7 measure achievement points in the second consecutive year it is identified as topped out, and beyond.

(v) *Measure bonus points.* MIPS eligible clinicians receive measure bonus points for the following measures, except as otherwise required under § 414.1335, regardless of whether the measure is included in the MIPS eligible clinician's total measure achievement points.

(A) *High priority measures.* Subject to paragraph (b)(1)(v)(A)(I) of this section, MIPS eligible clinicians receive 2 measure bonus points for each outcome and patient experience measure and 1 measure bonus point for each other high priority measure. Beginning with the 2021 MIPS payment year, MIPS eligible clinicians do not receive such measure bonus points for CMS Web Interface measures.

(I) *Limitations.* (i) Each high priority measure must have a benchmark at paragraph (b)(1)(ii) of this section, meet the case minimum requirement at (b)(1)(iii) of this section, meet the data completeness requirement at § 414.1340, and have a performance rate that is greater than zero.

(ii) For the 2019, 2020, and 2021 MIPS payment years, the total measure bonus points for high priority measures cannot exceed 10 percent of the total available measure achievement points.

(iii) Beginning with the 2021 MIPS payment year, MIPS eligible clinicians that collect data in accordance with § 414.1325 on a single measure via multiple collection types receive measure bonus points only once.

(B) *End-to-end electronic reporting.* Subject to paragraph (b)(1)(v)(B)(I) of this section, MIPS eligible clinicians receive 1 measure bonus point for each measure (except claims-based measures) submitted with end-to-end electronic reporting for a quality measure under certain criteria determined by the Secretary.

(I) *Limitations.* (i) For the 2019, 2020, and 2021 MIPS payment years, the total measure bonus points for measures submitted with end-to-end electronic reporting cannot exceed 10 percent of the total available measure achievement points.

(ii) Beginning with the 2021 MIPS payment year, MIPS eligible clinicians that collect data in accordance with § 414.1325 on a single measure via multiple collection types receive measure bonus points only once.

(C) *Small practices.* Beginning with the 2021 MIPS payment year, MIPS eligible clinicians in small practices receive 6 measure bonus points if they submit data to MIPS on at least 1 quality measure.

(vi) *Improvement scoring.* Improvement scoring is available to MIPS eligible clinicians that demonstrate improvement in performance in the current MIPS performance period compared to performance in the performance period immediately prior to the current MIPS performance period based on measure achievement points.

(A) Improvement scoring is available when the data sufficiency standard is met, which means when data are available and a MIPS eligible clinician has a quality performance category achievement percent score for the previous performance period and the current performance

period.

(1) Data must be comparable to meet the requirement of data sufficiency which means that the quality performance category achievement percent score is available for the current performance period and the previous performance period and quality performance category achievement percent scores can be compared.

(2) Quality performance category achievement percent scores are comparable when submissions are received from the same identifier for two consecutive performance periods.

(3) If the identifier is not the same for 2 consecutive performance periods, then for individual submissions, the comparable quality performance category achievement percent score is the highest available quality performance category achievement percent score associated with the final score from the prior performance period that will be used for payment for the individual. For group, virtual group, and APM Entity submissions, the comparable quality performance category achievement percent score is the average of the quality performance category achievement percent score associated with the final score from the prior performance period that will be used for payment for each of the individuals in the group.

(4) Improvement scoring is not available for clinicians who were scored under facility-based measurement in the performance period immediately prior to the current MIPS performance period.

(B) The improvement percent score may not total more than 10 percentage points.

(C) The improvement percent score is assessed at the performance category level for the quality performance category and included in the calculation of the quality performance category percent score as described in paragraph (b)(1)(vii) of this section.

(1) The improvement percent score is awarded based on the rate of increase in the

quality performance category achievement percent score of MIPS eligible clinicians from the previous performance period to the current performance period.

(2) An improvement percent score is calculated by dividing the increase in the quality performance category achievement percent score from the prior performance period to the current performance period by the prior performance period quality performance category achievement percent score multiplied by 10 percent.

(3) An improvement percent score cannot be lower than zero percentage points.

(4) For the 2020 and 2021 MIPS payment year, we will assume a quality performance category achievement percent score of 30 percent if a MIPS eligible clinician earned a quality performance category score less than or equal to 30 percent in the previous year.

(5) The improvement percent score is zero if the MIPS eligible clinician did not fully participate in the quality performance category for the current performance period.

(D) For the purpose of improvement scoring methodology, the term “quality performance category achievement percent score” means the total measure achievement points divided by the total available measure achievement points, without consideration of measure bonus points or improvement percent score.

(E) For the purpose of improvement scoring methodology, the term “improvement percent score” means the score that represents improvement for the purposes of calculating the quality performance category percent score as described in paragraph (b)(1)(vii) of this section.

(F) For the purpose of improvement scoring methodology, the term “fully participate” means the MIPS eligible clinician met all requirements in §§ 414.1335 and 414.1340.

(vii) *Quality performance category score.* A MIPS eligible clinician's quality performance category percent score is the sum of all the measure achievement points assigned

for the measures required for the quality performance category criteria plus the measure bonus points in paragraph (b)(1)(v) of this section. The sum is divided by the sum of total available measure achievement points. The improvement percent score in paragraph (b)(1)(vi) of this section is added to that result. The quality performance category percent score cannot exceed 100 percentage points.

(A) Beginning with the 2021 MIPS payment year, for each measure that a MIPS eligible clinician submits that is significantly impacted by clinical guideline changes or other changes that CMS believes may result in patient harm or misleading results, the total available measure achievement points are reduced by 10 points.

(B) Beginning with the 2021 MIPS payment year, for groups that submit 5 or fewer measures and register for the CAHPS for MIPS survey but do not meet the minimum beneficiary sampling requirements, the total available measure achievement points are reduced by 10 points.

(viii) *ICD-10 updates.* Beginning with the 2018 MIPS performance period, measures significantly impacted by ICD-10 updates, as determined by CMS, will be assessed based only on the first 9 months of the 12-month performance period. For purposes of this paragraph (b)(1)(viii), CMS will make a determination as to whether a measure is significantly impacted by ICD-10 coding changes during the performance period. CMS will publish on the CMS Web site which measures require a 9-month assessment process by October 1st of the performance period if technically feasible, but by no later than the beginning of the data submission period at § 414.1325(f)(1).

(2) *Cost performance category.* For each cost measure attributed to a MIPS eligible clinician, the clinician receives one to ten achievement points based on the clinician's performance on the measure during the performance period compared to the measure's

benchmark. Achievement points are awarded based on which benchmark decile range the MIPS eligible clinician's performance on the measure is between. CMS assigns partial points based on the percentile distribution.

(i) Cost measure benchmarks are determined by CMS based on cost measure performance during the performance period. At least 20 MIPS eligible clinicians or groups must meet the minimum case volume specified under § 414.1350(c) for a cost measure in order for a benchmark to be determined for the measure. If a benchmark is not determined for a cost measure, the measure will not be scored.

(ii) A MIPS eligible clinician must meet the minimum case volume specified under § 414.1350(c) to be scored on a cost measure.

(iii) The cost performance category percent score is the sum of the following, not to exceed 100 percent:

(A) The total number of achievement points earned by the MIPS eligible clinician divided by the total number of available achievement points; and

(B) The cost improvement score, as determined under paragraph (b)(2)(iv) of this section.

(iv) The cost improvement score is determined for a MIPS eligible clinician that demonstrates improvement in performance in the current MIPS performance period compared to their performance in the immediately preceding MIPS performance period.

(A) The cost improvement score is determined at the measure level for the cost performance category.

(B) The cost improvement score is calculated only when data sufficient to measure improvement is available. Sufficient data is available when a MIPS eligible clinician or group participates in MIPS using the same identifier in 2 consecutive performance periods and is

scored on the same cost measure(s) for 2 consecutive performance periods. If the cost improvement score cannot be calculated because sufficient data is not available, then the cost improvement score is zero.

(C) The cost improvement score is determined by comparing the number of measures with a statistically significant change (improvement or decline) in performance; a change is determined to be significant based on application of a t-test. The number of cost measures with a significant decline is subtracted from the number of cost measures with a significant improvement, with the result divided by the number of cost measures for which the MIPS eligible clinician or group was scored for 2 consecutive performance periods. The resulting fraction is then multiplied by the maximum cost improvement score.

(D) The cost improvement score cannot be lower than zero percentage points.

(E) The maximum cost improvement score for the 2020, 2021, 2022, and 2023 MIPS payment years is zero percentage points.

(v) A cost performance category percent score is not calculated if a MIPS eligible clinician or group is not attributed any cost measures for the performance period because the clinician or group has not met the minimum case volume specified by CMS for any of the cost measures or a benchmark has not been created for any of the cost measures that would otherwise be attributed to the clinician or group.

(3) *Improvement activities performance category.* Subject to paragraphs (b)(3)(i) and (ii) of this section, the improvement activities performance category score equals the total points for all submitted improvement activities divided by 40 points, multiplied by 100 percent. MIPS eligible clinicians (except for non-patient facing MIPS eligible clinicians, small practices, and practices located in rural areas and geographic HPSAs) receive 10 points for each medium-

weighted improvement activity and 20 points for each high-weighted improvement activity required under § 414.1360 on which data is submitted in accordance with § 414.1325. Non-patient facing MIPS eligible clinicians, small practices, and practices located in rural areas and geographic HPSAs receive 20 points for each medium-weighted improvement activity and 40 points for each high-weighted improvement activity required under § 414.1360 on which data is submitted in accordance with § 414.1325.

(i) For MIPS eligible clinicians participating in APMs, the improvement activities performance category score is at least 50 percent.

(ii) For MIPS eligible clinicians in a practice that is certified or recognized as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, the improvement activities performance category score is 100 percent. For the 2019 MIPS payment year, at least one practice site within a group's TIN must be certified or recognized as a patient-centered medical home or comparable specialty practice. For the 2020 MIPS payment year and future years, at least 50 percent of the practice sites within a group's TIN must be recognized as a patient-centered medical home or comparable specialty practice. MIPS eligible clinicians that wish to claim this status for purposes of receiving full credit in the improvement activities performance category must attest to their status as a patient-centered medical home or comparable specialty practice in order to receive this credit. A practice is certified or recognized as a patient-centered medical home if it meets any of the following criteria:

(A) The practice has received accreditation from one of four accreditation organizations that are nationally recognized;

(1) The Accreditation Association for Ambulatory Health Care;

(2) The National Committee for Quality Assurance (NCQA);

(3) The Joint Commission; or

(4) The Utilization Review Accreditation Commission (URAC).

(B) The practice is participating in a Medicaid Medical Home Model or Medical Home Model.

(C) The practice is a comparable specialty practice that has received the NCQA Patient-Centered Specialty Recognition.

(D) The practice has received accreditation from other certifying bodies that have certified a large number of medical organizations and meet national guidelines, as determined by the Secretary. The Secretary must determine that these certifying bodies must have 500 or more certified member practices, and require practices to include the following:

(1) Have a personal physician/clinician in a team-based practice.

(2) Have a whole-person orientation.

(3) Provide coordination or integrated care.

(4) Focus on quality and safety.

(5) Provide enhanced access.

(4) *Promoting Interoperability performance category.* (i) For the 2019 and 2020 MIPS payment years, a MIPS eligible clinician's Promoting Interoperability performance category score equals the sum of the base score, performance score, and any applicable bonus scores, not to exceed 100 percentage points. A MIPS eligible clinician cannot earn a performance score or bonus score unless they have earned a base score.

(A) A MIPS eligible clinician earns a base score by reporting for each base score measure, as applicable: the numerator (of at least one) and denominator, or a yes/no statement, or an exclusion.

(B) A MIPS eligible clinician earns a performance score by reporting on the performance score measures specified by CMS. A MIPS eligible clinician may earn up to 10 or 20 percentage points as specified by CMS for each performance score measure reported.

(C) A MIPS eligible clinician may earn the following bonus scores:

(1) A bonus score of 5 percentage points for reporting to one or more additional public health agencies or clinical data registries.

(2) A bonus score of 10 percentage points for attesting to completing one or more improvement activities specified by CMS using CEHRT.

(3) For the 2020 MIPS payment year, a bonus score of 10 percentage points for submitting data for the measures for the base score and the performance score generated solely from CEHRT as defined in § 414.1305 for 2019 and subsequent years.

(ii) For the 2021 and 2022 MIPS payment years, a MIPS eligible clinician's Promoting Interoperability performance category score equals the sum of the scores for each of the six required measures and any applicable bonus scores, not to exceed 100 points.

(A) A MIPS eligible clinician earns a score for each measure by reporting, as applicable: the numerator (of at least one) and denominator, or a yes/no statement. If an exclusion is reported for a measure, the points available for that measure are redistributed to another measure(s).

(B) Each required measure is worth 10, 20, or 40 points, as specified by CMS.

(C) Each optional measure is worth five bonus points.

(c) *Final score calculation.* Each MIPS eligible clinician receives a final score of 0 to 100 points for a performance period for a MIPS payment year calculated as follows. If a MIPS

eligible clinician is scored on fewer than 2 performance categories, he or she receives a final score equal to the performance threshold.

For the 2019 MIPS payment year:

Final score = [(quality performance category percent score × quality performance category weight) + (cost performance category percent score × cost performance category weight) + (improvement activities performance category score × improvement activities performance category weight) + (Promoting Interoperability performance category score × Promoting Interoperability performance category weight)], not to exceed 100 points.

For the 2020 MIPS payment year:

Final score = [(quality performance category percent score × quality performance category weight) + (cost performance category percent score × cost performance category weight) + (improvement activities performance category score × improvement activities performance category weight) + (Promoting Interoperability performance category score × Promoting Interoperability performance category weight)] × 100 + [the complex patient bonus + the small practice bonus], not to exceed 100 points.

Beginning with the 2021 MIPS payment year:

Final score = [(quality performance category percent score × quality performance category weight) + (cost performance category percent score × cost performance category weight) + (improvement activities performance category score × improvement activities performance category weight) + (Promoting Interoperability performance category score × Promoting Interoperability performance category weight)] × 100 + the complex patient bonus, not to exceed 100 points.

(1) *Performance category weights.* The weights of the performance categories in the final score are as follows, unless a different scoring weight is assigned under paragraph (c)(2) of this section:

- (i) Quality performance category weight is defined under § 414.1330(b).
- (ii) Cost performance category weight is defined under § 414.1350(d).
- (iii) Improvement activities performance category weight is defined under § 414.1355(b).
- (iv) Promoting Interoperability performance category weight is defined under § 414.1375(a).

(2) *Reweighting the performance categories.* (i) In accordance with paragraph (c)(2)(ii) of this section, a scoring weight different from the weights specified in paragraph (c)(1) of this section will be assigned to a performance category, and its weight as specified in paragraph (c)(1) of this section will be redistributed to another performance category or categories, in the following circumstances:

(A) CMS determines based on the following circumstances that there are not sufficient measures and activities applicable and available under section 1848(q)(5)(F) of the Act.

(1) For the quality performance category, CMS cannot calculate a score for the MIPS eligible clinician because there is not at least one quality measure applicable and available to the clinician.

(2) For the cost performance category, CMS cannot reliably calculate a score for the cost measures that adequately captures and reflects the performance of the MIPS eligible clinician.

(3) Beginning with the 2021 MIPS payment year, for the quality, cost, improvement activities, and Promoting Interoperability performance categories, the MIPS eligible clinician joins an existing practice during the final 3 months of the performance period year that is not participating in MIPS as a group or joins a practice that is newly formed during the final 3 months of the performance period year.

(4) For the Promoting Interoperability performance category beginning with the 2021 MIPS payment year, the MIPS eligible clinician is a physical therapist, occupational therapist, clinical psychologist, qualified audiologist, qualified speech-language pathologist, or a registered dietitian or nutrition professional. In the event that a MIPS eligible clinician submits data for the Promoting Interoperability performance category, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(5) For the Promoting Interoperability performance category for the 2019, 2020, and 2021 MIPS payment years, the MIPS eligible clinician is a nurse practitioner, physician assistant, clinical nurse specialist, or certified registered nurse anesthetist. In the event that a MIPS eligible clinician submits data for the Promoting Interoperability performance category, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(6) Beginning with the 2020 MIPS payment year, for the quality, cost, and improvement activities performance categories, the MIPS eligible clinician demonstrates through an application submitted to CMS that they were subject to extreme and uncontrollable circumstances that prevented the clinician from collecting information that the clinician would submit for a performance category or submitting information that would be used to score a performance category for an extended period of time. Beginning with the 2021 MIPS payment year, in the event that a MIPS eligible clinician submits data for the quality, cost, or improvement activities performance categories, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(7) For the 2019 MIPS payment year, for the quality and improvement activities performance categories, the MIPS eligible clinician was located in an area affected by extreme and uncontrollable circumstances as identified by CMS. In the event that a MIPS eligible clinician submits data for a performance category, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(8) Beginning with the 2020 MIPS payment year, for the quality, cost, and improvement activities performance categories, the MIPS eligible clinician was located in an area affected by extreme and uncontrollable circumstances as identified by CMS. In the event that a MIPS

eligible clinician submits data for the quality or improvement activities performance categories, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(B) Under section 1848(q)(5)(E)(ii) of the Act, CMS estimates that the proportion of MIPS eligible clinicians who are physicians as defined in section 1861(r) of the Act and earn a Promoting Interoperability performance category score of at least 75 percent is 75 percent or greater. The estimation is based on data from the performance period that occurs four years before the MIPS payment year and does not include physicians for whom the Promoting Interoperability performance category is weighted at zero percent.

(C) Under section 1848(o)(2)(D) of the Act, a significant hardship exception or other type of exception is granted to a MIPS eligible clinician based on the following circumstances for the Promoting Interoperability performance category. In the event that a MIPS eligible clinician submits data for the Promoting Interoperability performance category, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(1) The MIPS eligible clinician demonstrates through an application submitted to CMS that they lacked sufficient internet access during the performance period, and insurmountable barriers prevented the clinician from obtaining sufficient internet access.

(2) The MIPS eligible clinician demonstrates through an application submitted to CMS that they were subject to extreme and uncontrollable circumstances that caused their CEHRT to be unavailable.

(3) The MIPS eligible clinician was located in an area affected by extreme and uncontrollable circumstances as identified by CMS.

(4) The MIPS eligible clinician demonstrates through an application submitted to CMS that 50 percent or more of their outpatient encounters occurred in practice locations where they had no control over the availability of CEHRT.

(5) The MIPS eligible clinician is a non-patient facing MIPS eligible clinician as defined in § 414.1305.

(6) The MIPS eligible clinician is a hospital-based MIPS eligible clinician as defined in § 414.1305.

(7) The MIPS eligible clinician is an ASC-based MIPS eligible clinician as defined in § 414.1305.

(8) Beginning with the 2020 MIPS payment year, the MIPS eligible clinician demonstrates through an application submitted to CMS that their CEHRT was decertified either during the performance period for the MIPS payment year or during the calendar year preceding the performance period for the MIPS payment year, and the MIPS eligible clinician made a good faith effort to adopt and implement another CEHRT in advance of the performance period. In no case may a MIPS eligible clinician be granted this exception for more than 5 years.

(9) Beginning with the 2020 MIPS payment year, the MIPS eligible clinician demonstrates through an application submitted to CMS that they are in a small practice as defined in § 414.1305, and overwhelming barriers prevent them from complying with the requirements for the Promoting Interoperability performance category.

(ii) A scoring weight different from the weights specified in paragraph (c)(1) of this section will be assigned to a performance category, and its weight as specified in paragraph (c)(1) of this section will be redistributed to another performance category or categories, as follows:

(A) For the 2019 MIPS payment year:

Performance Category	Weighting for the 2019 MIPS Payment Year	Reweight Scenario If No Promoting Interoperability Performance Category Score	Reweight Scenario If No Quality Performance Category Percent Score	Reweight Scenario If No Improvement Activities Performance Category Score
Quality	60%	85%	0%	75%
Cost	0%	0%	0%	0%
Improvement Activities	15%	15%	50%	0%
Promoting Interoperability	25%	0%	50%	25%

(B) For the 2020 MIPS payment year:

Reweighting Scenario	Quality	Cost	Improvement Activities	Promoting Interoperability
No Reweighting Needed				
- Scores for all four performance categories	50%	10%	15%	25%
Reweight One Performance Category				
-No Cost	60%	0%	15%	25%
-No Promoting Interoperability	75%	10%	15%	0%
-No Quality	0%	10%	45%	45%
-No Improvement Activities	65%	10%	0%	25%
Reweight Two Performance Categories				
-No Cost and no Promoting Interoperability	85%	0%	15%	0%
-No Cost and no Quality	0%	0%	50%	50%
-No Cost and no Improvement Activities	75%	0%	0%	25%
-No Promoting Interoperability and no Quality	0%	10%	90%	0%
-No Promoting Interoperability and no Improvement Activities	90%	10%	0%	0%
-No Quality and no Improvement Activities	0%	10%	0%	90%

(C) For the 2021 MIPS payment year:

Reweighting Scenario	Quality	Cost	Improvement Activities	Promoting Interoperability
No Reweighting Needed				
- Scores for all four performance categories	45%	15%	15%	25%
Reweight One Performance Category				
-No Cost	60%	0%	15%	25%
-No Promoting Interoperability	70%	15%	15%	0%
-No Quality	0%	15%	40%	45%
-No Improvement Activities	60%	15%	0%	25%
Reweight Two Performance Categories				
-No Cost and no Promoting Interoperability	85%	0%	15%	0%
-No Cost and no Quality	0%	0%	50%	50%
-No Cost and no Improvement Activities	75%	0%	0%	25%
-No Promoting Interoperability and no Quality	0%	15%	85%	0%
-No Promoting Interoperability and no Improvement Activities	85%	15%	0%	0%
-No Quality and no Improvement Activities	0%	15%	0%	85%

(iii) For MIPS eligible clinicians submitting data as a group or virtual group, in order for the Promoting Interoperability performance category to be reweighted in accordance with paragraph (c)(2)(ii) of this section, all of the MIPS eligible clinicians in the group must qualify for reweighting based on the circumstances described in paragraph (c)(2)(i) of this section.

(3) *Complex patient bonus.* For the 2020 and 2021 MIPS payment years, provided that a MIPS eligible clinician, group, virtual group or APM entity submits data for at least one MIPS performance category for the applicable performance period for the MIPS payment year, a complex patient bonus will be added to the final score for the MIPS payment year, as follows:

(i) For MIPS eligible clinicians and groups, the complex patient bonus is calculated as follows: [The average HCC risk score assigned to beneficiaries (pursuant to the HCC risk adjustment model established by CMS pursuant to section 1853(a)(1) of the Act) seen by the MIPS eligible clinician or seen by clinicians in a group] + [the dual eligible ratio \times 5].

(ii) For APM entities and virtual groups, the complex patient bonus is calculated as follows: [The beneficiary weighted average HCC risk score for all MIPS eligible clinicians, and if technically feasible, TINs for models and virtual groups which rely on complete TIN participation within the APM entity or virtual group, respectively] + [the average dual eligible ratio for all MIPS eligible clinicians, and if technically feasible, TINs for models and virtual groups which rely on complete TIN participation, within the APM entity or virtual group, respectively, \times 5].

(iii) The complex patient bonus cannot exceed 5.0.

(4) *Small practice bonus.* A small practice bonus of 5 points will be added to the final score for the 2020 MIPS payment year for MIPS eligible clinicians, groups, virtual groups, and APM Entities that meet the definition of a small practice as defined at § 414.1305 and participate in MIPS by submitting data on at least one performance category in the 2018 MIPS performance period.

(d) *Scoring for APM Entities.* MIPS eligible clinicians in APM Entities that are subject to the APM scoring standard are scored using the methodology under § 414.1370.

(e) *Scoring for facility-based measurement.* For the payment in 2021 MIPS payment year and subsequent years and subject to paragraph (e)(6)(vi) of this section, a MIPS eligible clinician or group will be scored under the quality and cost performance categories using the methodology described in this paragraph (e).

(1) *General.* The facility-based measurement scoring standard is the MIPS scoring methodology applicable for MIPS eligible clinicians identified as meeting the requirements in paragraph (e)(2) of this section.

(i) The measures used for facility-based measurement are the measure set finalized for the fiscal year value-based purchasing program for which payment begins during the applicable MIPS performance period.

(ii) Beginning with the 2021 MIPS payment year, the scoring methodology applicable for MIPS eligible clinicians scored with facility-based measurement is the Total Performance Score methodology adopted for the Hospital VBP Program, for the fiscal year for which payment begins during the applicable MIPS performance period.

(2) *Eligibility for facility-based measurement.* MIPS eligible clinicians are eligible for facility-based measurement for a MIPS payment year if they are determined to be facility-based as an individual clinician or as part of a group, as follows:

(i) *Facility-based individual determination.* A MIPS eligible clinician is facility-based if the clinician meets all of the following criteria:

(A) Furnishes 75 percent or more of his or her covered professional services in sites of service identified by the place of service codes used in the HIPAA standard transaction as an inpatient hospital, on-campus outpatient hospital, or emergency room setting based on claims for a 12-month segment beginning on October 1 of the calendar year 2 years prior to the applicable performance period and ending on September 30 of the calendar year preceding the performance period with a 30-day claims run out.

(B) Furnishes at least 1 covered professional service in sites of service identified by the place of service codes used in the HIPAA standard transaction as an inpatient hospital, or emergency room setting.

(C) Can be attributed, under the methodology specified in paragraph (e)(5) of this section, to a facility with a value-based purchasing score for the applicable period.

(ii) *Facility-based group determination.* A facility-based group is a group in which 75 percent or more of its eligible clinician NPIs billing under the group's TIN meet the requirements under paragraph (e)(2)(i) of this section.

(3) [Reserved]

(4) *Data submission for facility-based measurement.* There are no data submission requirements for individual clinicians to be scored under facility-based measurement. A group must submit data in the improvement activities or Promoting Interoperability performance categories in order to be scored as a facility-based group.

(5) *Determination of applicable facility score.* (i) A facility-based clinician is scored with facility-based measurement using the score derived from the value-based purchasing score for the facility at which the clinician provided services to the most Medicare beneficiaries during the period the claims are drawn from in paragraph (e)(2) of this section. If there is an equal number of Medicare beneficiaries treated at more than one facility, the value-based purchasing score for the highest scoring facility is used.

(ii) A facility-based group is scored with facility-based measurement using the score derived from the value-based purchasing score for the facility at which the plurality of clinicians identified as facility-based would have had their score determined under paragraph (e)(5)(i) of this section.

(6) *MIPS performance category scoring under the facility-based measurement scoring standard*—(i) *Measures*. The quality and cost measures are those adopted under the value-based purchasing program of the facility for the year described in paragraph (e)(1)(i) of this section.

(ii) *Benchmarks*. The benchmarks are those adopted under the value-based purchasing program of the facility program for the year described in paragraph (e)(1) of this section.

(iii) *Performance period*. The performance period for facility-based measurement is the performance period for the measures adopted under the value-based purchasing program of the facility program for the year described in paragraph (e)(1) of this section.

(iv) *Quality*. The quality performance category percent score is established by determining the percentile performance of the facility in the value-based purchasing program for the specified year as described in paragraph (e)(1) of this section and awarding a score associated with that same percentile performance in the MIPS quality performance category percent score for those MIPS-eligible clinicians who are not eligible to be scored using facility-based measurement for the MIPS payment year. A clinician or group receiving a facility-based performance score will not earn improvement points based on prior performance in the MIPS quality performance category

(v) *Cost*. The cost performance category percent score is established by determining the percentile performance of the facility in the value-based purchasing program for the specified year as described in paragraph (e)(1) of this section and awarding a score associated with that same percentile performance in the MIPS cost performance category percent score for those MIPS eligible clinicians who are not eligible to be scored using facility-based measurement for the MIPS payment year. A clinician or group receiving a facility-based performance score will not earn improvement points based on prior performance in the MIPS cost category.

(A) *Other cost measures.* MIPS eligible clinicians who are scored under facility-based measurement are not scored on cost measures described in paragraph (b)(2) of this section.

(B) [Reserved]

(vi) *Use of score from facility-based measurement.* The MIPS quality and cost performance category scores will be based on the facility-based measurement scoring methodology described in paragraph (e)(6) of this section unless a clinician or group receives a higher combined MIPS quality and cost performance category score through another MIPS submission.

37. Section 414.1395 is amended by revising paragraphs (b) and (c) to read as follows:

§ 414.1395 Public reporting.

* * * * *

(b) *Maintain existing public reporting standards.* With the exception of data that must be mandatorily reported on Physician Compare, for each program year, CMS relies on established public reporting standards to guide the information available for inclusion on Physician Compare. The public reporting standards require data included on Physician Compare to be statistically valid, reliable, and accurate; comparable across collection types; and meet the reliability threshold. And, to be included on the public facing profile pages, the data must also resonate with website users, as determined by CMS.

(c) *First year measures.* For each program year, CMS does not publicly report any first year measure for the first 2 years, meaning any measure in its first 2 years of use in the quality and cost performance categories. After the first 2 years, CMS reevaluates measures to determine when and if they are suitable for public reporting.

* * * * *

38. Section 414.1400 is revised to read as follows:

§ 414.1400 Third party intermediaries.

(a) *General.* (1) MIPS data may be submitted on behalf of a MIPS eligible clinician, group, or virtual group by any of the following third party intermediaries:

- (i) A QCDR;
- (ii) A qualified registry;
- (iii) A health IT vendor; or
- (iv) A CMS-approved survey vendor.

(2) QCDRs, qualified registries, and health IT vendors may submit MIPS data for any of the following MIPS performance categories:

- (i) Quality, except for data on the CAHPS for MIPS survey;
- (ii) Improvement activities; or
- (iii) Promoting Interoperability, if the MIPS eligible clinician, group, or virtual group is using CEHRT.

(3) CMS-approved survey vendors may submit data on the CAHPS for MIPS survey for the MIPS quality performance category.

(4) To be approved as a third party intermediary, an entity must agree to meet the applicable requirements of this section, including, but not limited to, the following:

- (i) A third party intermediary's principle place of business and retention of any data must be based in the U.S.
- (ii) If the data is derived from CEHRT, a QCDR, qualified registry, or health IT vendor must be able to indicate its data source.
- (iii) All data must be submitted in the form and manner specified by CMS.

(iv) If the clinician chooses to opt-in in accordance with § 414.1310, the third party intermediary must be able to transmit that decision to CMS.

(5) All data submitted to CMS by a third party intermediary on behalf of a MIPS eligible clinician, group or virtual group must be certified by the third party intermediary as true, accurate, and complete to the best of its knowledge. Such certification must be made in a form and manner and at such time as specified by CMS.

(b) *QCDR approval criteria--*(1) *QCDR self-nomination*. For the 2020 and 2021 MIPS payment years, entities seeking to qualify as a QCDR must self-nominate September 1 until November 1 of the CY preceding the applicable performance period. For the 2022 MIPS payment year and future years, entities seeking to qualify as a QCDR must self-nominate during a 60-day period during the CY preceding the applicable performance period (beginning no earlier than July 1 and ending no later than September 1). Entities seeking to qualify as a QCDR for a performance period must provide all information required by CMS at the time of self-nomination and must provide any additional information requested by CMS during the review process. For the 2021 MIPS payment year and future years, existing QCDRs that are in good standing may attest that certain aspects of their previous year's approved self-nomination have not changed and will be used for the applicable performance period.

(2) *Establishment of a QCDR entity*. (i) Beginning with the 2022 MIPS Payment Year, the QCDR must have at least 25 participants by January 1 of the year prior to the applicable performance period.

(ii) If the entity uses an external organization for purposes of data collection, calculation, or transmission, it must have a signed, written agreement with the external organization that specifically details the responsibilities of the entity and the external organization. The written

agreement must be effective as of September 1 of the year preceding the applicable performance period.

(3) *QCDR measures for the quality performance category.* (i) For purposes of QCDRs submitting data for the MIPS quality performance category, CMS considers the following types of quality measures to be QCDR measures:

(A) Measures that are not included in the MIPS final list of quality measures described in § 414.1330(a)(1) for the applicable MIPS payment year; and

(B) Measures that are included in the MIPS final list of quality measures described in § 414.1330(a)(1) for the applicable MIPS payment year, but have undergone substantive changes, as determined by CMS.

(ii) For the 2020 MIPS payment year and future years, an entity seeking to become a QCDR must submit specifications for each measure, activity, and objective that the entity intends to submit to for MIPS (including the information described in paragraphs (b)(3)(ii)(A) and (B) of this section) at the time of self-nomination. In addition, no later than 15 calendar days following CMS approval of any QCDR measure specifications, the entity must publicly post the measure specifications for each QCDR measure (including the CMS-assigned QCDR measure ID) and provide CMS with a link to where this information is posted.

(A) For QCDR measures, the entity must submit the measure specifications for each QCDR measure, including: Name/title of measures, NQF number (if NQF-endorsed), descriptions of the denominator, numerator, and when applicable, denominator exceptions, denominator exclusions, risk adjustment variables, and risk adjustment algorithms.

(B) For MIPS quality measures, the entity must submit the MIPS measure IDs and specialty-specific measure sets, as applicable.

(iii) A QCDR must include the CMS-assigned QCDR measure ID when submitting data on any QCDR measure to CMS.

(c) *Qualified registry approval criteria--(1) Qualified registry self-nomination.* For the 2020 and 2021 MIPS payment years, entities seeking to qualify as a qualified registry must self-nominate from September 1 until November 1 of the CY preceding the applicable performance period. For the 2022 MIPS payment year and future years, entities seeking to qualify as a qualified registry must self-nominate during a 60-day period during the CY preceding the applicable performance period (beginning no earlier than July 1 and ending no later than September 1). Entities seeking to qualify as a qualified registry for a performance period must provide all information required by CMS at the time of self-nomination and must provide any additional information requested by CMS during the review process. For the 2021 MIPS payment year and future years, existing qualified registries that are in good standing may attest that certain aspects of their previous year's approved self-nomination have not changed and will be used for the applicable performance period.

(2) *Establishment of a qualified registry entity.* Beginning with the 2022 MIPS Payment Year, the qualified registry must have at least 25 participants by January 1 of the year prior to the applicable performance period.

(d) *Health IT vendor approval criteria.* Health IT vendors must meet the criteria specified at paragraph (a)(4) of this section.

(e) *CMS-approved survey vendor approval criteria.* Entities seeking to be a CMS-approved survey vendor for any MIPS performance period must submit a survey vendor application to CMS in a form and manner specified by CMS for each MIPS performance period for which it wishes to transmit such data. The application and any supplemental information

requested by CMS must be submitted by deadlines specified by CMS. For an entity to be a CMS-approved survey vendor, it must meet the following criteria:

(1) The entity must have sufficient experience, capability, and capacity to accurately report CAHPS data, including:

(i) At least 3 years of experience administering mixed-mode surveys (that is, surveys that employ multiple modes to collect data), including mail survey administration followed by survey administration via Computer Assisted Telephone Interview (CATI);

(ii) At least 3 years of experience administering surveys to a Medicare population;

(iii) At least 3 years of experience administering CAHPS surveys within the past 5 years;

(iv) Experience administering surveys in English and at least one other language for which a translation of the CAHPS for MIPS survey is available;

(v) Use equipment, software, computer programs, systems, and facilities that can verify addresses and phone numbers of sampled beneficiaries, monitor interviewers, collect data via CATI, electronically administer the survey and schedule call-backs to beneficiaries at varying times of the day and week, track fielded surveys, assign final disposition codes to reflect the outcome of data collection of each sampled case, and track cases from mail surveys through telephone follow-up activities; and

(vi) Employment of a program manager, information systems specialist, call center supervisor and mail center supervisor to administer the survey.

(2) The entity has certified that it has the ability to maintain and transmit quality data in a manner that preserves the security and integrity of the data.

(3) The entity has successfully completed, and has required its subcontractors to successfully complete, vendor training(s) administered by CMS or its contractors.

(4) The entity has submitted a quality assurance plan and other materials relevant to survey administration, as determined by CMS, including cover letters, questionnaires and telephone scripts.

(5) The entity has agreed to participate and cooperate, and has required its subcontractors to participate and cooperate, in all oversight activities related to survey administration conducted by CMS or its contractors.

(6) The entity has sent an interim survey data file to CMS that establishes the entity's ability to accurately report CAHPS data.

(f) *Remedial action and termination of third party intermediaries.* (1) If CMS determines that a third party intermediary has ceased to meet one or more of the applicable criteria for approval, or has submitted data that is inaccurate, unusable, or otherwise compromised, CMS may take one or more of the following remedial actions after providing written notice to the third party intermediary:

(i) Require the third party intermediary to submit a corrective action plan (CAP) to CMS to address the identified deficiencies or data issue, including the actions it will take to prevent the deficiencies or data issues from recurring. The CAP must be submitted to CMS by a date specified by CMS.

(ii) Publicly disclose the entity's data error rate on the CMS website until the data error rate falls below 3 percent.

(2) CMS may immediately or with advance notice terminate the ability of a third party intermediary to submit MIPS data on behalf of a MIPS eligible clinician, group, or virtual group for one or more of the following reasons:

(i) CMS has grounds to impose remedial action;

(ii) CMS has not received a CAP within the specified time period or the CAP is not accepted by CMS; or

(iii) The third party intermediary fails to correct the deficiencies or data errors by the date specified by CMS.

(3) For purposes of paragraph (f) of this section, CMS may determine that submitted data is inaccurate, unusable, or otherwise compromised if the submitted data:

(i) Includes, without limitation, TIN/NPI mismatches, formatting issues, calculation errors, or data audit discrepancies; and

(ii) Affects more than 3 percent of the total number of MIPS eligible clinicians or group for which data was submitted by the third party intermediary.

(g) *Auditing of entities submitting MIPS data.* Any third party intermediary must comply with the following procedures as a condition of its qualification and approval to participate in MIPS as a third party intermediary.

(1) The entity must make available to CMS the contact information of each MIPS eligible clinician or group on behalf of whom it submits data. The contact information must include, at a minimum, the MIPS eligible clinician or group's practice phone number, address, and, if available, email.

(2) The entity must retain all data submitted to CMS for purposes of MIPS for 6 years from the end of the MIPS performance period.

(3) For the purposes of auditing, CMS may request any records or data retained for the purposes of MIPS for up to 6 years from the end of the MIPS performance period.

39. Section 414.1405 is amended by—

a. Adding paragraphs (b)(6) and (d)(5);

- b. Revising paragraph (e); and
- c. Adding paragraph (f).

The additions and revision read as follows:

§ 414.1405 Payment.

* * * * *

(b) * * *

(6) The performance threshold for the 2021 MIPS payment year is 30 points.

* * * * *

(d) * * *

(5) The additional performance threshold for the 2021 MIPS payment year is 75 points.

(e) *Application of adjustments to payments.* Except as specified in paragraph (f) of this section, in the case of covered professional services (as defined in section 1848(k)(3)(A) of the Act) furnished by a MIPS eligible clinician during a MIPS payment year beginning with 2019, the amount otherwise paid under Part B with respect to such covered professional services and MIPS eligible clinician for such year, is multiplied by 1, plus the sum of the MIPS payment adjustment factor divided by 100, and as applicable, the additional MIPS payment adjustment factor divided by 100.

(f) *Exception to application of MIPS payment adjustment factors to model-specific payments under section 1115A APMs.* Effective for the 2019 MIPS payment year, the payment adjustment factors specified under paragraph (e) of this section are not applicable to payments that meet all of the following conditions:

- (1) Are made only to participants in a model tested under section 1115A of the Act;

(2) Would otherwise be subject to the requirement to apply the MIPS payment adjustment factors if the payment is made with respect to a MIPS eligible clinician participating in a section 1115A model; and

(3) Either have a specified payment amount or are paid according to a methodology for calculating a model-specific payment that is applied in a consistent manner to all model participants, such that application of the MIPS payment adjustment factors would potentially interfere with CMS's ability to effectively evaluate the impact of the APM.

40. Section 414.1415 is amended, effective January 1, 2019, by revising paragraphs (a)(1)(i) and (ii), (b)(1), (c) introductory text, (c)(3)(i)(A), and (c)(6) to read as follows:

§ 414.1415 Advanced APM criteria.

(a)* * *

(1)* * *

(i) Require at least 50 percent, or for QP Performance Periods beginning in 2019, 75 percent of eligible clinicians in each participating APM Entity group, or for APMs in which hospitals are the APM Entities, each hospital, to use CEHRT to document and communicate clinical care to their patients or health care providers; or

(ii) For QP Performance Periods prior to 2019, for the Shared Savings Program, apply a penalty or reward to an APM Entity based on the degree of the use of CEHRT of the eligible clinicians in the APM Entity.

(b) * * *

(1) To be an Advanced APM, an APM must include quality measure performance as a factor when determining payment to participants for covered professional services under the terms of the APM.

* * * * *

(c) *Financial risk.* To be an Advanced APM, except as described in paragraph (c)(6) of this section, an APM must either meet the financial risk standard under paragraph (c)(1) or (2) of this section and the nominal amount standard under paragraph (c)(3) or (4) of this section or be an expanded Medical Home Model under section 1115A(c) of the Act.

* * * * *

(3) * * *

(i) * * *

(A) For QP Performance Periods beginning in 2017, through 2024, 8 percent of the average estimated total Medicare Parts A and B revenue of all providers and suppliers in participating APM Entities; or

* * * * *

(6) *Capitation.* A full capitation arrangement meets this Advanced APM criterion. For purposes of this part, a full capitation arrangement means a payment arrangement in which a per capita or otherwise predetermined payment is made under the APM for all items and services furnished to a population of beneficiaries during a fixed period of time, and no settlement is performed to reconcile or share losses incurred or savings earned by the APM Entity.

Arrangements between CMS and Medicare Advantage Organizations under the Medicare Advantage program (42 U.S.C. 422) are not considered capitation arrangements for purposes of this paragraph (c)(6).

* * * * *

41. Section 414.1415 is further amended (effective January 1, 2010) by revising paragraphs (b)(2) and (3) to read as follows:

§ 414.1415 Advanced APM criteria.

* * * *

(b) * *

(2) At least one of the quality measures used in the payment arrangement as specified in paragraph (b)(1) of this section must:

(i) For QP Performance Periods before January 1, 2020, have an evidence-based focus, be reliable and valid, and meet at least one of the following criteria:

(A) Used in the MIPS quality performance category, as described in § 414.1330;

(B) Endorsed by a consensus-based entity;

(C) Developed under section 1848(s) of the Act;

(D) Submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act; or

(E) Any other quality measures that CMS determines to have an evidence-based focus and to be reliable and valid; and

(ii) For QP Performance Periods beginning on or after January 1, 2020, be:

(A) Finalized on the MIPS final list of measures, as described in § 414.1330;

(B) Endorsed by a consensus-based entity; or

(C) Determined by CMS to be evidenced-based, reliable, and valid.

(3) In addition to the quality measure described under paragraph (b)(2) of this section, the quality measures upon which an Advanced APM bases the payment in paragraph (b)(1) of this section must include at least one additional measure that is an outcome measure unless CMS determines that there are no available or applicable outcome measures included in the MIPS final quality measures list for the Advanced APM's first QP Performance Period. Beginning January

1, 2020, the included outcome measure must satisfy the criteria in paragraph (b)(2) of this section.

* * * * *

42. Section 414.1420 is amended effective January 1, 2019, by revising paragraphs (d) introductory text, (d)(3)(i), and (d)(7) to read as follows:

§ 414.1420 Other payer advanced APM criteria.

* * * * *

(d) *Financial risk.* To be an Other Payer Advanced APM, except as described in paragraph (d)(7) of this section, a payment arrangement must meet either the financial risk standard under paragraph (d)(1) or (2) of this section and the nominal amount standard under paragraph (d)(3) or (4) of this section, or be a Medicaid Medical Home Model with criteria comparable to an expanded Medical Home Model under section 1115A(c) of the Act.

* * * * *

(3) * * *

(i) For QP Performance Periods 2019 through 2024, 8 percent of the total combined revenues from the payer to providers and other entities under the payment arrangement if financial risk is expressly defined in terms of revenue; or, 3 percent of the expected expenditures for which an APM Entity is responsible under the payment arrangement.

* * *

(7) *Capitation.* A full capitation arrangement meets this Other Payer Advanced APM criterion. For purposes of paragraph (d)(3) of this section, a full capitation arrangement means a payment arrangement in which a per capita or otherwise predetermined payment is made under the payment arrangement for all items and services furnished to a population of beneficiaries

during a fixed period of time, and no settlement is performed for the purpose of reconciling or sharing losses incurred or savings earned by the participant. Arrangements made directly between CMS and Medicare Advantage Organizations under the Medicare Advantage program (42 U.S.C. 422) are not considered capitation arrangements for purposes of this paragraph (c)(7).

* * * * *

43. Section 414.1420 is further amended (effective January 1, 2020) by revising paragraphs (b), (c)(2) and (3) to read as follows:

§ 414.1420 Other payer advanced APM criteria.

* * * * *

(b) *Use of CEHRT.* To be an Other Payer Advanced APM, CEHRT must be used by at least 50 percent, or for QP Performance Periods on or after January 1, 2020, 75 percent of participants in each participating APM Entity group, or each hospital if hospitals are the APM Entities, in the other payer arrangement to document and communicate clinical care.

(c)* * *

(2) At least one of the quality measures used in the payment arrangement as specified in paragraph (c)(1) of this section must:

(i) For QP Performance Period before January 1, 2020, have an evidence-based focus, be reliable and valid, and meet at least one of the following criteria:

(A) Used in the MIPS quality performance category, as described in § 414.1330;

(B) Endorsed by a consensus-based entity;

(C) Developed under section 1848(s) of the Act;

(D) Submitted in response to the MIPS Call for Quality Measures under section 1848(q)(2)(D)(ii) of the Act; or

(E) Any other quality measures that CMS determines to have an evidence-based focus and to be reliable and valid; and

(ii) For QP Performance Periods beginning on or after January 1, 2020, be:

(A) Finalized on the MIPS final list of measures, as described in § 414.1330;

(B) Endorsed by a consensus-based entity; or

(C) Determined by CMS to be evidenced-based, reliable, and valid.

(3) To meet the quality measure use criterion under paragraph (c)(1) of this section, a payment arrangement must:

(i) For QP Performance Periods before January 1, 2020, use an outcome measure if there is an applicable outcome measure on the MIPS quality measure list. This criterion also applies for payment arrangements determined to be Other Payer Advanced APMs on or before January 1, 2020, but only for the Other Payer Advanced APM determination made with respect to the arrangement for the CY 2020 QP Performance Period (regardless of whether that determination is a single- or multi- year determination).

(ii) For QP Performance Periods on or after January 1, 2020, in addition to the quality measure described under paragraph (c)(2) of this section, use at least one additional measure that is an outcome measure and meets the criteria in paragraph (c)(2)(ii) of this section if there is such an applicable outcome measure on the MIPS quality measure list.

* * * * *

44. Section 414.1440 is amended by revising paragraphs (d)(1) through (3) to read as follows:

§ 414.1440 Qualifying APM participant determination: All-payer combination option.

* * * * *

(d) * * *

(1) CMS performs QP determinations following the QP Performance Period using payment amount and/or patient count information submitted from January 1 through each of the respective QP determination dates: March 31, June 30, and August 31. CMS will use data for the same time periods for the Medicare and other payer portions of Threshold Score calculations under the All-Payer Combination Option. CMS will use the payment amount or patient count method, applying the more advantageous of the two for both the Medicare and other payer portions of the Threshold score calculation, regardless of the method used for the Medicare Threshold Score calculation.

(2) An APM Entity may request that CMS make QP determinations at the APM Entity level, an eligible clinician may request that CMS make QP determinations at the eligible clinician level, and an eligible clinician or an APM Entity may request that CMS makes QP determinations at the TIN-level in instances where all clinicians who reassigned billing rights to the TIN are participating in a single APM Entity. CMS makes QP determinations at either the APM Entity, eligible clinician, or TIN level. Eligible clinicians assessed at the eligible clinician level under the Medicare Option at § 414.1425(b)(2) will be assessed at the eligible clinician level only under the All-Payer Combination Option. Eligible Clinicians may meet the Medicare and the All-Payer Combination Option thresholds using the payment amount method for both thresholds, the patient account method for both thresholds, or the payment amount method for one threshold and the patient account method for the other threshold.

(3) CMS uses data at the same level for the Medicare and other payer portions of Threshold Score calculations under the All-Payer Combination Option. When QP determinations are made at the eligible clinician or, at the TIN level when all clinicians who have

reassigned billing rights to the TIN are included in a single APM Entity; and if the Medicare Threshold score for the APM Entity group is higher than when calculated for the eligible clinician or TIN, CMS makes QP determinations using a weighted Medicare Threshold Score that is factored into an All-Payer Combination Option Threshold Score.

* * * * *

45. Section 414.1445 is amended by revising paragraph (b)(1), adding paragraph (c)(2)(i), and reserving paragraph (c)(2)(ii) to read as follows:

§ 414.1445 Determination of other payer advanced APMs.

* * * * *

(b)* * *

(1) *Payer initiated Other Payer Advanced APM determination process.* Beginning in 2018, and each year thereafter, at a time determined by CMS a payer with a Medicare Health Plan payment arrangement may request, in a form and manner specified by CMS, that CMS determine whether a Medicare Health Plan payment arrangement meets the Other Payer Advanced APM criteria set forth in § 414.1420. A payer with a Medicare Health Plan payment arrangement must submit its requests by the annual Medicare Advantage bid deadline of the year prior to the relevant QP Performance Period. A Medicare Health Plan is a Medicare Advantage plan, a section 1876 cost plan, a PACE organization operated under section 1894, and any similar plan which provides Medicare benefits under demonstration or waiver authority (other than an APM as defined in section 1833(z)(3)(C) of the Act).

* * * * *

(c) * * *

(2) * * *

(i) Based on the submission by an eligible clinician or payer of evidence that CMS determines sufficiently demonstrates that CEHRT is used as specified in § 414.1420(b) by participants in the payment arrangement, CMS will consider the CEHRT criterion in § 414.1420(b) is satisfied for that payment arrangement.

(ii) [Reserved]

* * * * *

**PART 415—SERVICES FURNISHED BY PHYSICIANS IN PROVIDERS,
SUPERVISING PHYSICIANS IN TEACHING SETTINGS, AND RESIDENTS IN
CERTAIN SETTINGS**

46. The authority citation for part 415 is revised to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

47. Section 415.172 is amended by revising paragraph (b) to read as follows:

§ 415.172 Physician fee schedule payment for services of teaching physicians.

* * * * *

(b) *Documentation.* Except for services furnished as set forth in §§ 415.174 (concerning an exception for services furnished in hospital outpatient and certain other ambulatory settings), 415.176 (concerning renal dialysis services), and 415.184 (concerning psychiatric services), the medical records must document the teaching physician was present at the time the service is furnished. The presence of the teaching physician during procedures and evaluation and management services may be demonstrated by the notes in the medical records made by a physician, resident, or nurse.

* * * * *

48. Section 415.174 is amended—

- a. In paragraph (a)(3)(iii) by removing “,” and adding in its place “; and”;
- b. In paragraph (a)(3)(iv) by removing “; and” and adding in its place “.”;
- c. By removing paragraph (a)(3)(v); and
- d. By adding paragraph (a)(6).

The addition reads as follows:

§ 415.174 Exception: Evaluation and management services furnished in certain centers.

(a) * * *

(6) The medical records must document the extent of the teaching physician’s participation in the review and direction of services furnished to each beneficiary. The extent of the teaching physician’s participation may be demonstrated by the notes in the medical records made by a physician, resident, or nurse.

* * * * *

PART 425—MEDICARE SHARED SAVINGS PROGRAM

49. The authority citation for part 425 is revised to read as follows:

Authority: 42 U.S.C. 1302, 1306, 1395hh, and 1395jjj.

50. Section 425.20 is amended—

- a. By revising the definition of “Agreement period”;
- b. By adding in alphabetical order definitions for “Certified Electronic Health Record Technology (CEHRT)” and “Eligible clinician”; and
- c. By revising the definition of “Performance year”.

The revisions and additions read as follows:

§ 425.20 Definitions.

* * * * *

Agreement period means the term of the participation agreement.

* * * * *

Certified Electronic Health Record Technology (CEHRT) has the same meaning given this term under § 414.1305 of this chapter.

* * * * *

Eligible clinician has the same meaning given this term under § 414.1305 of this chapter.

* * * * *

Performance year means the 12-month period beginning on January 1 of each year during the agreement period, unless otherwise specified in § 425.200(c) or noted in the participation agreement.

* * * * *

§ 425.100 [Amended]

51. Section 425.100 is amended—

a. In paragraph (b) by removing the phrase “under § 425.604, § 425.606 or § 425.610” and adding in its place the phrase “under § 425.604, § 425.606, § 425.609 or § 425.610”; and

b. In paragraph (c) by removing the phrase “under § 425.606 or § 425.610” and adding in its place the phrase “under § 425.606, § 425.609 or § 425.610”.

52. Section 425.200 is amended—

a. By revising paragraph (a);

b. By revising the heading of paragraph (b);

c. By removing paragraph (b)(2) introductory text, adding a heading for paragraph (b)(2), and revising paragraph (b)(2)(ii); and

d. By removing paragraph (b)(3) introductory text, adding a heading for paragraph (b)(3); and

e. By revising paragraphs (c) and (d).

The revisions and additions read as follows:

§ 425.200 Participation agreement with CMS.

(a) *General.* In order to participate in the Shared Savings Program, an ACO must enter into a participation agreement with CMS for a period of not less than the number of years specified in this section.

(b) *Agreement period.** * *

(2) *For 2013 and through 2016.** * *

(ii) The term of the participation agreement is 3 years unless all of the following conditions are met to extend the participation agreement by 6 months:

(A) The ACO entered an agreement period starting on January 1, 2016.

(B) The ACO elects to extend its agreement period until June 30, 2019.

(I) The ACO's election to extend its agreement period is made in the form and manner and according to the timeframe established by CMS; and

(2) An ACO executive who has the authority to legally bind the ACO must certify the election described in paragraph (b)(2)(ii)(B) of this section.

(3) *For 2017 and all subsequent years.* * * *

(c) *Performance year.* The ACO's performance year under the participation agreement is the 12 month period beginning on January 1 of each year during the term of the participation agreement unless otherwise noted in its participation agreement, and except as follows:

(1) For an ACO with a start date of April 1, 2012, or July 1, 2012, the ACO's first performance year is defined as 21 months or 18 months, respectively.

(2) For an ACO that entered a first or second agreement period with a start date of January 1, 2016, and that elects to extend its agreement period by a 6-month period under paragraph (b)(2)(ii)(B) of this section, the ACO's fourth performance year is the 6-month period between January 1, 2019, and June 30, 2019.

(d) *Submission of measures.* For each performance year of the agreement period, ACOs must submit measures in the form and manner required by CMS according to § 425.500(c), and as applicable according to §§ 425.608 and 425.609.

* * * * *

§ 425.221 [Amended]

53. Section 425.221 is amended—

- a. In paragraph (b)(1)(i) by removing the phrase “December 31st of such performance year” and adding in its place the phrase “the last calendar day of the performance year”; and
- b. In paragraph (b)(2) by removing the phrase “December 31 of a performance year” and adding in its place the phrase “the last calendar day of a performance year”.

54. Section 425.302 is amended—

- a. In paragraph (a)(3)(i) by removing the phrase “requirements; and” and adding in its place the phrase “requirements;”;
- b. In paragraph (a)(3)(ii) by removing the phrase “owed to CMS.” and adding in its place the phrase “owed to CMS; and”; and
- c. Adding paragraph (a)(3)(iii).

The addition reads as follows:

§ 425.302 Program requirements for data submission and certifications.

(a) * * *

(3) * * *

(iii) That the percentage of eligible clinicians participating in the ACO that use CEHRT to document and communicate clinical care to their patients or other health care providers meets or exceeds the applicable percentage specified by CMS at § 425.506(f).

* * * * *

§ 425.315 [Amended]

55. Section 425.315 is amended in paragraph (a)(1)(ii) by removing the phrase “§ 425.604(f), § 425.606(h) or § 425.610(h)” and adding in its place the phrase “§ 425.604(f), § 425.606(h), § 425.609(e) or § 425.610(h)”.

56. Section 425.400 is amended by—

a. Revising paragraph (a)(1)(ii);

b. Revising paragraphs (c)(1)(iv) introductory text, (c)(1)(iv)(A), (c)(1)(iv)(B) introductory text, and (c)(1)(iv)(B)(5); and

c. Adding paragraphs (c)(1)(iv)(B)(6) and (7).

The revisions and additions read as follows:

§ 425.400 General.

(a)(1) * * *

(ii) CMS applies a step-wise process based on the beneficiary's utilization of primary care services provided under Title XVIII by a physician who is an ACO professional during each performance year for which shared savings are to be determined and, with respect to ACOs

participating in a 6-month performance year during CY 2019, during the entirety of CY 2019 as specified in § 425.609.

* * * *

(c) * *

(1) * *

(iv) For performance years starting on January 1, 2019, and subsequent performance years as follows:

(A) CPT codes:

(1) 99201 through 99215 (codes for office or other outpatient visit for the evaluation and management of a patient).

(2) 99304 through 99318 (codes for professional services furnished in a nursing facility; services identified by these codes furnished in a SNF are excluded).

(3) 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit).

(4) 99341 through 99350 (codes for evaluation and management services furnished in a patients' home for claims identified by place of service modifier 12).

(5) 99487, 99489 and 99490 (codes for chronic care management).

(6) 99495 and 99496 (codes for transitional care management services).

(7) 99497 and 99498 (codes for advance care planning).

(8) 96160 and 96161 (codes for administration of health risk assessment).

(9) 99354 and 99355 (add-on codes, for prolonged evaluation and management or psychotherapy services beyond the typical service time of the primary procedure; when the base code is also a primary care service code under this paragraph (c)(1)).

(10) 99484, 99492, 99493 and 99494 (codes for behavioral health integration services).

(B) HCPCS codes:

* * * * *

(5) G0444 (codes for annual depression screening service).

(6) G0442 (code for alcohol misuse screening service).

(7) G0443 (code for alcohol misuse counseling service).

57. Section 425.401 is amended by revising paragraph (b) introductory text to read as follows:

§ 425.401 Criteria for a beneficiary to be assigned to an ACO.

* * * * *

(b) A beneficiary is excluded from the prospective assignment list of an ACO that is participating under prospective assignment under § 425.400(a)(3) at the end of a performance or benchmark year and quarterly during each performance year consistent with § 425.400(a)(3)(ii), or at the end of CY 2019 as specified in § 425.609(b)(1)(ii), if the beneficiary meets any of the following criteria during the performance or benchmark year:

* * * * *

58. Section 425.402 is amended by revising paragraph (e)(2) to read as follows:

§ 425.402 Basic assignment methodology.

* * * * *

(e) * * *

(2) Beneficiaries are added to the ACO's list of assigned beneficiaries if all of the following conditions are satisfied:

(i) For performance year 2018:

(A) The beneficiary must have had at least one primary care service during the assignment window as defined under § 425.20 with a physician who is an ACO professional in the ACO who is a primary care physician as defined under § 425.20 or who has one of the primary specialty designations included in paragraph (c) of this section.

(B) The beneficiary meets the eligibility criteria established at § 425.401(a) and must not be excluded by the criteria at § 425.401(b). The exclusion criteria at § 425.401(b) apply for purposes of determining beneficiary eligibility for alignment to ACOs under all tracks based on the beneficiary's designation of an ACO professional as responsible for coordinating their overall care under paragraph (e) of this section.

(C) The beneficiary must have designated an ACO professional who is a primary care physician as defined at § 425.20, a physician with a specialty designation included at paragraph (c) of this section, or a nurse practitioner, physician assistant, or clinical nurse specialist as responsible for coordinating their overall care.

(D) If a beneficiary has designated a provider or supplier outside the ACO who is a primary care physician as defined at § 425.20, a physician with a specialty designation included at paragraph (c) of this section, or a nurse practitioner, physician assistant, or clinical nurse specialist, as responsible for coordinating their overall care, the beneficiary is not added to the ACO's list of assigned beneficiaries under the assignment methodology in paragraph (b) of this section.

(ii) For performance years starting on January 1, 2019, and subsequent performance years:

(A) The beneficiary meets the eligibility criteria established at § 425.401(a) and must not be excluded by the criteria at § 425.401(b). The exclusion criteria at § 425.401(b) apply for

purposes of determining beneficiary eligibility for alignment to an ACO based on the beneficiary's designation of an ACO professional as responsible for coordinating their overall care under paragraph (e) of this section, regardless of the ACO's assignment methodology selection under § 425.400(a)(4)(ii).

(B) The beneficiary must have designated an ACO professional as responsible for coordinating their overall care.

(C) If a beneficiary has designated a provider or supplier outside the ACO as responsible for coordinating their overall care, the beneficiary is not added under the assignment methodology in paragraph (b) of this section to the ACO's list of assigned beneficiaries for a 12-month performance year or the ACO's list of assigned beneficiaries for a 6-month performance year, which is based on the entire CY 2019 as provided in § 425.609.

(D) The beneficiary is not assigned to an entity participating in a model tested or expanded under section 1115A of the Act under which claims-based assignment is based solely on claims for services other than primary care services and for which there has been a determination by the Secretary that waiver of the requirement in section 1899(c)(2)(B) of the Act is necessary solely for purposes of testing the model.

* * * * *

§ 425.404 [Amended]

59. Section 425.404 is amended in paragraph (b) by removing the phrase “For performance year 2019 and subsequent performance years” and adding in its place the phrase “For performance years starting on January 1, 2019, and subsequent performance years”.

60. Section 425.502 is amended—

- a. In paragraph (e)(4)(vi) by removing the phrase “For performance year 2017” and adding in its place the phrase “For performance year 2017 and subsequent performance years”;
- b. By adding a new paragraph (e)(4)(vii);
- c. By revising paragraph (f) introductory text;
- d. By redesignating paragraphs (f)(1) and (2) as paragraphs (f)(2)(i) and (ii);
- e. By adding a new paragraph (f)(1);
- f. By adding a new paragraph (f)(2) introductory text;
- g. In newly redesignated paragraph (f)(2)(i) by removing the phrase “for performance year 2017” and adding in its place the phrase “for the relevant performance year”;
- h. By removing paragraph (f)(4); and
- i. By redesignating paragraph (f)(5) as paragraph (f)(4).

The revisions and additions read as follows:

§ 425.502 Calculating the ACO quality performance score.

* * * *

(e) * * *

(4) * * *

(vii) For performance year 2017 and subsequent performance years, if an ACO receives the mean Shared Savings Program ACO quality score under paragraph (f) of this section, in the

next performance year for which the ACO receives a quality performance score based on its own quality reporting, quality improvement is measured based on a comparison between the performance in that year and the most recently available prior performance year in which the ACO reported quality.

(f) *Extreme and uncontrollable circumstances.* For performance year 2017 and subsequent performance years, including the applicable quality data reporting period for the performance year if the quality reporting period is not extended, CMS uses an alternative approach to calculating the quality score for ACOs affected by extreme and uncontrollable circumstances instead of the methodology specified in paragraphs (a) through (e) of this section as follows:

(1) CMS determines the ACO was affected by an extreme and uncontrollable circumstance based on either of the following:

(i) Twenty percent or more of the ACO's assigned beneficiaries reside in an area identified under the Quality Payment Program as being affected by an extreme and uncontrollable circumstance.

(A) Assignment is determined under subpart E of this part.

(B) In making this determination for performance year 2017, CMS uses the final list of beneficiaries assigned to the ACO for the performance year. For performance year 2018 and subsequent performance years, CMS uses the list of assigned beneficiaries used to generate the Web Interface quality reporting sample.

(ii) The ACO's legal entity is located in an area identified under the Quality Payment Program as being affected by an extreme and uncontrollable circumstance. An ACO's legal entity

location is based on the address on file for the ACO in CMS' ACO application and management system.

(2) If CMS determines the ACO meets the requirements of paragraph (f)(1) of this section, CMS calculates the ACO's quality score as follows:

* * * * *

61. Section 425.506 is amended—

a. In paragraph (b) by removing the phrase “As part of the quality performance score” and adding in its place the phrase “For performance years 2012 through 2018, as part of the quality performance score”;

b. In paragraph (c) by removing the phrase “Performance on this measure” and adding in its place the phrase “For performance years 2012 through 2018, performance on this measure”;

c. In paragraph (e) introductory text by removing the phrase “For 2017 and subsequent years” and adding in its place the phrase “For 2017 and 2018”; and

d. By adding paragraph (f).

The addition reads as follows:

§ 425.506 Incorporating reporting requirements related to adoption of certified electronic health record technology.

* * * * *

(f) For performance years starting on January 1, 2019, and subsequent performance years, ACOs in a track that —

(1) Does not meet the financial risk standard to be an Advanced APM must certify annually that the percentage of eligible clinicians participating in the ACO that use CEHRT to

document and communicate clinical care to their patients or other health care providers meets or exceeds 50 percent; or

(2) Meets the financial risk standard to be an Advanced APM must certify annually that the percentage of eligible clinicians participating in the ACO that use CEHRT to document and communicate clinical care to their patients or other health care providers meets or exceeds the threshold established under § 414.1415(a)(1)(i) of this chapter.

62. Section 425.602 is amended by adding paragraph (c) to read as follows:

§ 425.602 Establishing, adjusting, and updating the benchmark for an ACO's first agreement period.

* * * * *

(c) *January 1, 2019 through June 30, 2019 performance year.* In determining performance for the January 1, 2019 through June 30, 2019 performance year described in § 425.609(b) CMS does all of the following:

(1) When adjusting the benchmark using the methodology set forth in paragraph (a)(9) of this section and § 425.609(b), CMS adjusts for severity and case mix between BY3 and CY 2019.

(2) When updating the benchmark using the methodology set forth in paragraph (b) of this section and § 425.609(b), CMS updates the benchmark based on growth between BY3 and CY 2019.

63. Section 425.603 is amended by adding paragraph (g) to read as follows:

§ 425.603 Resetting, adjusting, and updating the benchmark for a subsequent agreement period.

* * * * *

(g) In determining performance for the January 1, 2019 through June 30, 2019 performance year described in § 425.609(b) CMS does all of the following:

(1) When adjusting the benchmark using the methodology set forth in paragraph (c)(10) of this section and § 425.609(b), CMS adjusts for severity and case mix between BY3 and CY 2019.

(2) When updating the benchmark using the methodology set forth in paragraph (d) of this section and § 425.609(b), CMS updates the benchmark based on growth between BY3 and CY 2019.

64. Section 425.604 is amended by adding paragraph (g) to read as follows:

§ 425.604 Calculation of savings under the one-sided model.

* * * * *

(g) *January 1, 2019 through June 30, 2019 performance year.* Shared savings for the January 1, 2019 through June 30, 2019 performance year are calculated as described in § 425.609.

65. Section 425.606 is amended—

a. In paragraph (i) introductory text by removing the phrase “For performance year 2017” and adding in its place the phrase “For performance year 2017 and subsequent performance years”;

b. In paragraph (i)(1) remove the phrase “2017”; and

c. By adding paragraph (j).

The addition reads as follows:

§ 425.606 Calculation of shared savings and losses under Track 2.

* * * * *

(j) *January 1, 2019 through June 30, 2019.* Shared savings or shared losses for the January 1, 2019 through June 30, 2019 performance year are calculated as described in § 425.609.

66. Section 425.609 is added to read as follows:

§ 425.609 Determining performance for a 6-month performance year during CY 2019.

(a) *General.* An ACO's financial and quality performance for a 6-month performance year during 2019 are determined as described in this section.

(b) *January 2019 through June 2019.* For ACOs participating in a 6-month performance year from January 1, 2019, through June 30, 2019, under § 425.200(b)(2)(ii)(B), CMS reconciles the ACO for the period from January 1, 2019, through June 30, 2019, after the conclusion of CY 2019, based on the 12-month calendar year and pro-rates shared savings or shared losses to reflect the ACO's participation from January 1, 2019, through June 30, 2019. CMS does all of the following to determine financial and quality performance:

(1) Uses the ACO participant list in effect for the performance year beginning January 1, 2019, to determine beneficiary assignment, using claims for the entire calendar year, as specified in §§ 425.402 and 425.404, and according to the ACO's track as specified in § 425.400.

(i) For ACOs under preliminary prospective assignment with retrospective reconciliation the assignment window is CY 2019.

(ii) For ACOs under prospective assignment—

(A) Medicare fee-for-service beneficiaries are prospectively assigned to the ACO based on the beneficiary's use of primary care services in the most recent 12 months for which data are available; and

(B) Beneficiaries remain prospectively assigned to the ACO at the end of CY 2019 if they do not meet any of the exclusion criteria under § 425.401(b) during the calendar year.

(2) Uses the ACO's quality performance for the 2019 reporting period to determine the ACO's quality performance score as specified in § 425.502. The ACO's latest certified ACO participant list is used to determine the quality reporting samples for the 2019 reporting year for an ACO that extends its participation agreement for the 6-month performance year from January 1, 2019, through June 30, 2019, under § 425.200(b)(2)(ii)(B).

(3) Uses the methodology for calculating shared savings or shared losses applicable to the ACO under the terms of the participation agreement that was in effect on January 1, 2019.

(i) The ACO's historical benchmark is determined according to either § 425.602 (first agreement period) or § 425.603 (second agreement period) except as follows:

(A) The benchmark is adjusted for changes in severity and case mix between BY3 and CY 2019 using the methodology that accounts separately for newly and continuously assigned beneficiaries using prospective HCC risk scores and demographic factors as described under §§ 425.604(a)(1) through (3), 425.606(a)(1) through (3), and 425.610(a)(1) through (3).

(B) The benchmark is updated to CY 2019 according to the methodology described under § 425.602(b), § 425.603(b), or § 425.603(d), based on whether the ACO is in its first or second agreement period, and for an ACO in a second agreement period, the date on which that agreement period began.

(ii) The ACO's financial performance is determined based on the track the ACO is participating under during the performance year starting on January 1, 2019 (§ 425.604, § 425.606 or § 425.610), unless otherwise specified. In determining ACO financial performance, CMS does all of the following:

(A) Average per capita Medicare Parts A and B fee-for-service expenditures for CY 2019 are calculated for the ACO's performance year assigned beneficiary population identified in paragraph (b)(1) of this section.

(B) Expenditures calculated in paragraph (b)(3)(ii)(A) of this section are compared to the ACO's updated benchmark determined according to paragraph (b)(3)(i) of this section.

(C)(I) The ACO's performance year assigned beneficiary population identified in paragraph (b)(1) of this section is used to determine the MSR for Track 1 ACOs and the variable MSR/MLR for ACOs in a two-sided model that selected this option at the start of their agreement period. For two-sided model ACOs that selected a fixed MSR/MLR at the start of the ACO's agreement period, this fixed MSR/MLR is applied. In the event an ACO's performance year assigned population identified in paragraph (b)(1) of this section is below 5,000 beneficiaries, the MSR/MLR is determined according to § 425.110(b).

(2) To qualify for shared savings an ACO must do all of the following:

(i) Have average per capita Medicare Parts A and B fee-for-service expenditures for its assigned beneficiary population for CY 2019 below its updated benchmark costs for the year by at least the MSR established for the ACO based on the track the ACO is participating under during the performance year starting on January 1, 2019 (§ 425.604, § 425.606 or § 425.610) and paragraph (b)(3)(ii)(C)(I) of this section.

(ii) Meet the minimum quality performance standards established under § 425.502 and according to paragraph (b)(2) of this section.

(iii) Otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(3) To be responsible for sharing losses with the Medicare program, an ACO's average per capita Medicare Parts A and B fee-for-service expenditures for its assigned beneficiary population for CY 2019 must be above its updated benchmark costs for the year by at least the MLR established for the ACO based on the track the ACO is participating under during the performance year starting on January 1, 2019 (§ 425.606 or § 425.610) and paragraph (b)(3)(ii)(C)(1) of this section.

(D) For an ACO that meets all the requirements to receive a shared savings payment under paragraph (b)(3)(ii)(C)(2) of this section—

(1) The final sharing rate, determined based on the track the ACO is participating under during the performance year starting on January 1, 2019 (§ 425.604, § 425.606 or § 425.610), is applied to all savings under the updated benchmark specified under paragraph (b)(3)(i) of this section, not to exceed the performance payment limit for the ACO based on its track; and

(2) After applying the applicable performance payment limit, CMS pro-rates any shared savings amount determined under paragraph (b)(3)(ii)(D)(1) of this section by multiplying the amount by one-half, which represents the fraction of the calendar year covered by the period from January 1, 2019, through June 30, 2019.

(E) For an ACO responsible for shared losses under paragraph (b)(3)(ii)(C)(3) of this section—

(1) The shared loss rate, determined based on the track the ACO is participating under during the performance year starting on January 1, 2019 (§ 425.606 or § 425.610), is applied to all losses under the updated benchmark specified under paragraph (b)(3)(i) of this section, not to exceed the loss recoupment limit for the ACO based on its track; and

(2) After applying the applicable loss recoupment limit, CMS pro-rates any shared losses amount determined under paragraph (b)(3)(ii)(E)(I) of this section by multiplying the amount by one-half, which represents the fraction of the calendar year covered by the period from January 1, 2019, through June 30, 2019.

(c) [Reserved]

(d) *Extreme and uncontrollable circumstances.* For ACOs affected by extreme and uncontrollable circumstances during CY 2019—

(1) In calculating the amount of shared losses owed, CMS makes adjustments to the amount determined in paragraph (b)(3)(ii)(E)(I) of this section, as specified in § 425.606(i) or § 425.610(i), as applicable; and

(2) In determining the ACO's quality performance score for the 2019 quality reporting period, CMS uses the alternative scoring methodology specified in § 425.502(f).

(e) *Notification of savings and losses.* CMS notifies the ACO of shared savings or shared losses for the January 1, 2019 through June 30, 2019 performance year, consistent with the notification requirements specified in §§ 425.604(f), 425.606(h), and 425.610(h), as applicable:

(1) CMS notifies an ACO in writing regarding whether the ACO qualifies for a shared savings payment, and if so, the amount of the payment due.

(2) CMS provides written notification to an ACO of the amount of shared losses, if any, that it must repay to the program.

(3) If an ACO has shared losses, the ACO must make payment in full to CMS within 90 days of receipt of notification.

67. Section 425.610 is amended—

a. In paragraph (i) introductory text by removing the phrase “For performance year 2017” and adding in its place the phrase “For performance year 2017 and subsequent performance years”;

b. In paragraph (i)(1) by removing the phrase “2017”; and

c. By adding paragraph (j).

The addition reads as follows:

§ 425.610 Calculation of shared savings and losses under Track 3.

* * * * *

(j) *January 1, 2019 through June 30, 2019 performance year.* Shared savings or shared losses for the January 1, 2019 through June 30, 2019 performance year are calculated as described in § 425.609.

68. Section 425.702 is amended by adding paragraph (d) to read as follows:

§ 425.702 Aggregate reports.

* * * * *

(d) For an ACO eligible to be reconciled under § 425.609(b), CMS shares with the ACO quarterly aggregate reports as provided in paragraphs (b) and (c)(1)(ii) of this section for CY 2019.

**PART 495—STANDARDS FOR THE ELECTRONIC HEALTH RECORD
TECHNOLOGY INCENTIVE PROGRAM**

69. The authority citation for part 495 is revised to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

70. Section 495.4 is amended in the definition of “EHR reporting period” by adding

paragraph (1)(v) to read as follows:

§ 495.4 Definitions.

* * * *

EHR reporting period. * * *

(1) * * *

(v) Under the Medicaid Promoting Interoperability Program, for the CY 2021 payment year:

(A) For the EP first demonstrating he or she is a meaningful EHR user, any continuous 90-day period within CY 2021 that ends before October 31, 2021, or that ends before an earlier date in CY 2021 that is specified by the state and approved by CMS in the State Medicaid HIT plan described at § 495.332.

(B) For the EP who has successfully demonstrated he or she is a meaningful EHR user in any prior year, any continuous 90-day period within CY 2021 that ends before October 31, 2021, or that ends before an earlier date in CY 2021 that is specified by the state and approved by CMS in the State Medicaid HIT plan described at § 495.332.

* * * *

71. Section 495.24 is amended by revising paragraphs (d)(6)(i)(B) and (d)(8)(i)(B)(2) to read as follows:

§ 495.24 Stage 3 meaningful use objectives and measures for EPs, eligible hospitals and CAHs for 2019 and subsequent years.

* * * *

(d) * * *

(6) * * *

(i) * * *

(B) *Measures*. In accordance with paragraph (a)(2) of this section, an EP must satisfy 2 out of the 3 following measures in paragraphs (d)(6)(i)(B)(1) through (3) of this section except those measures for which an EP qualifies for an exclusion under paragraph (a)(3) of this section.

(1) During the EHR reporting period, more than 5 percent of all unique patients (or their authorized representatives) seen by the EP actively engage with the electronic health record made accessible by the provider and do either of the following:

(i) View, download or transmit to a third party their health information;

(ii) Access their health information through the use of an API that can be used by applications chosen by the patient and configured to the API in the provider's CEHRT; or

(iii) A combination of paragraphs (d)(6)(i)(B)(1)(i) and (ii) of this section.

(2) A secure message was sent using the electronic messaging function of CEHRT to the patient (or their authorized representatives), or in response to a secure message sent by the patient, for more than 5 percent of all unique patients seen by the EP during the EHR reporting period.

(3) Patient generated health data or data from a nonclinical setting is incorporated into the CEHRT for more than 5 percent of all unique patients seen by the EP during the EHR reporting period.

* * * * *

(8) * * *

(i) * * *

(B) * * *

(2) *Syndromic surveillance reporting.* The EP is in active engagement with a public health agency to submit syndromic surveillance data from an urgent care setting, or from any other setting from which ambulatory syndromic surveillance data are collected by the state or a local public health agency.

* * * * *

72. Section 495.332 is amended by adding paragraphs (f)(3), (4), and (5) to read as follows:

§ 495.332 State Medicaid health information technology (HIT) plan requirements.

* * * * *

(f) * * *

(3) An alternative date within CY 2021 by which all “EHR reporting periods” (as defined under § 495.4) for the CY 2021 payment year for Medicaid EPs demonstrating they are meaningful EHR users must end. The alternative date selected by the state must be earlier than October 31, 2021, and must not be any earlier than the day prior to the attestation deadline for Medicaid EPs attesting to that state.

(4) An alternative date within CY 2021 by which all clinical quality measure reporting periods for the CY 2021 payment year for Medicaid EPs demonstrating they are meaningful EHR users must end. The alternative date selected by the state must be earlier than October 31, 2021, and must not be any earlier than the day prior to the attestation deadline for Medicaid EPs attesting to that state.

(5) For the CY 2019 payment year and beyond, a state-specific listing of which clinical quality measures selected by CMS are considered to be high priority measures for purposes of Medicaid EP clinical quality measure reporting.

* * * * *

Dated: October 26, 2018.

Seema Verma,

Administrator,

Centers for Medicare & Medicaid Services.

Dated: October 30, 2018.

Alex M. Azar II,

Secretary,

Department of Health and Human Services.

Note: The following appendices will not appear in the Code of Federal Regulations.

APPENDIX 1: FINALIZED MIPS QUALITY MEASURES

NOTE: Except as otherwise finalized in this final rule, previously finalized measures and specialty measure sets will continue to apply for the 2021 MIPS payment year and future years.

TABLE Group A: Finalized New Quality Measures for Inclusion in MIPS for the 2021 MIPS Payment Year and Future Years

A.1. Continuity of Pharmacotherapy for Opioid Use Disorder

Category	Description
NQF #:	Not Applicable (NA)
Quality #:	468
Description:	Percentage of adults aged 18 years and older with pharmacotherapy for opioid use disorder (OUD) who have at least 180 days of continuous treatment.
Measure Steward:	University of Southern California
Numerator:	Adults in the denominator who have at least 180 days of continuous pharmacotherapy with a medication prescribed for OUD without a gap of more than 7 days.
Denominator:	Adults aged 18 years and older who had a diagnosis of OUD.
Exclusions:	Pharmacotherapy for OUD initiated after June 30th of performance period.
Measure Type:	Process
Measure Domain:	Effective Clinical Care
High Priority Measure:	Yes (Appropriate Use and Opioid-Related)
Collection Type:	MIPS CQMs Specifications
Rationale:	<p>We are adopting this measure because the opioid epidemic is immensely affecting the nation and it is imperative to measure opioid use. This clinical concept is currently not represented within MIPS. There are three existing opioid use related measures for MIPS but none cover the topic of pharmacotherapy. This measure captures patients diagnosed with opioid use disorder (OUD) who are receiving and adhering to the prescribed therapy. The performance data provided by the measure steward supports there is opportunity for improvement. Based on the measure steward research, only about a quarter to a third of individuals with commercial insurance or Medicaid coverage taking medication for OUD remained on the medication for at least 180 days without a gap of more than 7 days. The MAP acknowledged the public health importance of measures that address opioid use disorder and noted the gap in this area. However, the MAP recognized that the current measure is specified and tested at the health plan and state level and recommended the measure be refined and resubmitted prior to rulemaking because the measure has not been tested or endorsed at the clinician or clinician group level. While we agree that the measure should be tested at the clinician level, we believe there is an urgent need for measures that address the opioid epidemic affecting the nation. We believe that the health plan level version of the measure can be adapted to the clinician level by revising the measure analytics to assess the proportion of patients with opioid use disorder that achieve continuity of pharmacotherapy aggregated at the clinician level.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>
Comment:	One commenter supported adoption of new measure Q468: Continuity of Pharmacotherapy for Opioid Use Disorder, but has concerns about the potential for confounders in the measure data sources. The commenter urged CMS to consider, and account for the possibilities of confounders as the agency determines whether and how to adopt this measure.
Response:	We thank the commenter for their support. We will work with the measure steward to consider accounting for confounders when implementing this measure, but maintain the notion that the measure is appropriate for implementation. This measure also addresses an at-risk population not addressed within MIPS measures which outweighs the risk of potential variables.
FINAL ACTION:	We are finalizing the <i>Continuity of Pharmacotherapy for Opioid Use Disorder</i> measure as proposed for the 2019 Performance Period and future years.

A.2. Average Change in Functional Status Following Lumbar Spine Fusion Surgery

Category	Description
NQF #:	2643
Quality #:	469
Description:	For patients age 18 and older undergoing lumbar spine fusion surgery, the average change from pre-operative functional status to 1 year (9 to 15 months) post-operative functional status using the Oswestry Disability Index (ODI version 2.1a) patient reported outcome tool.
Measure Steward:	Minnesota Community Measurement
Numerator:	<p>The average change (preoperative to 1 year post-operative) in functional status for all patients in the denominator.</p> <p>There is not a traditional numerator for this measure; the measure calculating the average change in functional status score from pre-operative to post-operative functional status score. The measure is NOT aiming for a numerator target value for a post-operative ODI score.</p> <p>The average change is calculated as follows: Change is first calculated for each patient and then changed scores are summed and then an average is determined. Measure calculation takes into account those patients that have an improvement and those patients whose function decreases post-operatively. For example: Patient Pre-op ODI :I Post-op ODI :I Change in ODI Patient A: I 47 :I 18 :I 29 Patient B: I 45 :I 52 :I -7 Patient C: I 56 :I 12 :I 44 Patient D: I 62 :I 25 :I 37 Patient E: I 42 :I 57 :I -15 Patient F: I 51 :I 10 :I 41 Patient G: I 62 :I 25 :I 37 Patient H: I 43 :I 20 :I 23 Patient I: I 74 :I 35 :I 39 Patient J: I 59 :I 23 :I 36 Average change in ODI 1 year post-op 26.4 points on a 100 point scale</p>
Denominator:	<p>Eligible Population: Patients with lumbar spine fusion procedures (Arthrodesis Value Set) occurring during a 12-month period for patients age 18 and older at the start of that period.</p> <p>Denominator: Patients within the eligible population whose functional status was measured by the Oswestry Disability Index, version 2.1a (ODI, v2.1a) within 3 months preoperatively AND at 1 year (+/- 3 months) postoperatively.</p> <p>*The measure of average change in function can only be calculated if both a pre-operative and post-operative PRO assessment are completed</p>
Exclusions:	<p>The following exclusions must be applied to the eligible population: Patient had cancer (Spine Cancer Value Set), fracture (Spine Fracture Value Set) or infection (Spine Infection Value Set) related to the spine. Patient had idiopathic or congenital scoliosis (Congenital Scoliosis Value Set)</p>
Measure Type:	Patient Reported Outcome
Measure Domain:	Person and Caregiver-Centered Experience and Outcomes
High Priority Measure:	Yes (Patient Reported Outcome)
Collection Type:	MIPS CQMs Specifications
Rationale:	<p>We are adopting this measure because it measures an important patient reported outcome evaluating the functional status change from pre-to post-operative. Results of the measure can be used by clinicians in evaluating whether the patient's functional status has improved post-operatively. The MAP supported this measure for rulemaking and recognized that improvement in functional status is an important outcome to patients and was encouraged by the potential addition of more patient-reported outcome measures to the MIPS set.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>
<p>Comment: One commenter supported this new measure and applauded CMS for proposing to adopt four patient-reported outcome measures. The commenter stated that patient-reported outcomes reflect issues that are important to patients and provide a valuable perspective on care that cannot be obtained from other data sources (for example, severity of pain, physical functioning). Another commenter is pleased this measure emphasizes the change in functional status.</p> <p>Response: We thank the commenters for their support.</p> <p>Comment: One commenter recommended using the Patient-Reported Outcome Measurement Information System (PROMIS) as an alternative to the Oswestry Disability Index (ODI) as the functional status assessment basis for this quality measure.</p> <p>Response: The measure steward has developed and tested this measure using the ODI tool to assess the change in functional status. We do not believe that the PROMIS scale will add value to this quality measure. Rather, we believe that the addition of the PROMIS scale introduces variability and would not provide a standardized tool to assess functional status. We do not own this measure and encourage the commenter to collaborate with the measure steward to expand the assessment tools.</p> <p>Comment: One commenter did not support the addition of this measure, stating that the validity, reliability, and informativeness of PROMs are uncertain.</p> <p>Response: Although we agree PROMs can be challenging to implement, the measure steward has fully tested this measure for validity and reliability to obtain NQF</p>	

Category	Description
	<p>endorsement. PROMs have been deemed one of our priorities as it is important to ensure patients are engaged in their care and are an important component in evaluating outcomes. The Oswestry Disability Index is a standardized tool that will allow eligible clinicians to track the progress of their patient's functional improvement. Therefore, we respectfully disagree that PROMs are not informative for improving patient outcomes and clinician quality performance.</p> <p>FINAL ACTION: We are finalizing the <i>Average Change in Functional Status Following Lumbar Spine Fusion Surgery</i> measure as proposed for the 2019 Performance Period and future years.</p>

A.3. Average Change in Functional Status Following Total Knee Replacement Surgery

Category	Description																				
NQF #:	2653																				
Quality #:	470																				
Description:	For patients age 18 and older undergoing total knee replacement surgery, the average change from pre-operative functional status to 1 year (9 to 15 months) post-operative functional status using the Oxford Knee Score (OKS) patient reported outcome tool.																				
Measure Steward:	Minnesota Community Measurement																				
Numerator:	<p>There is not a traditional numerator for this measure; the measure is calculating the average change in functional status score from pre-operative to post-operative functional status score. The measure is NOT aiming for a numerator target value for a post-operative OKS score.</p> <p>For example: The average change in knee function was an increase of 15.9 points 1 year post-operatively on a 48 point scale.</p> <p>The average change is calculated as follows: Change is first calculated for each patient and then changed scores are summed and then an average is determined. Measure calculation takes into account patients who have an improvement and patients whose function decreases post-operatively. For example: Patient Pre-op OKS:I Postop OKS:I Change in OKS</p> <table> <tr> <td>Patient A: I 33 :I 45 :I 12</td><td>Patient K: I 24 :I 43 :I 19</td></tr> <tr> <td>Patient B: I 17 :I 39 :I 22</td><td>Patient L: I 29 :I 34 :I 5</td></tr> <tr> <td>Patient C: I 16 :I 31 :I 15</td><td>Patient M: I 23 :I 39 :I 16</td></tr> <tr> <td>Patient D: I 23 :I 40 :I 17</td><td>Patient N: I 29 :I 45 :I 16</td></tr> <tr> <td>Patient E: I 34 :I 42 :I 8</td><td>Patient O: I 29 :I 45 :I 16</td></tr> <tr> <td>Patient F: I 10 :I 42 :I 32</td><td>Patient P: I 34 :I 41 :I 7</td></tr> <tr> <td>Patient G: I 14 :I 44 :I 30</td><td>Patient Q: I 11 :I 14 :I 3</td></tr> <tr> <td>Patient H: I 32 :I 44 :I 12</td><td>Patient R: I 13 :I 39 :I 26</td></tr> <tr> <td>Patient I: I 19 :I 45 :I 26</td><td>Patient S: I 18 :I 45 :I 27</td></tr> <tr> <td>Patient J: I 26 :I 19 :I -7</td><td></td></tr> </table> <p>Average change in OKS 1 year post-op 15.9 points on a 48 point scale</p>	Patient A: I 33 :I 45 :I 12	Patient K: I 24 :I 43 :I 19	Patient B: I 17 :I 39 :I 22	Patient L: I 29 :I 34 :I 5	Patient C: I 16 :I 31 :I 15	Patient M: I 23 :I 39 :I 16	Patient D: I 23 :I 40 :I 17	Patient N: I 29 :I 45 :I 16	Patient E: I 34 :I 42 :I 8	Patient O: I 29 :I 45 :I 16	Patient F: I 10 :I 42 :I 32	Patient P: I 34 :I 41 :I 7	Patient G: I 14 :I 44 :I 30	Patient Q: I 11 :I 14 :I 3	Patient H: I 32 :I 44 :I 12	Patient R: I 13 :I 39 :I 26	Patient I: I 19 :I 45 :I 26	Patient S: I 18 :I 45 :I 27	Patient J: I 26 :I 19 :I -7	
Patient A: I 33 :I 45 :I 12	Patient K: I 24 :I 43 :I 19																				
Patient B: I 17 :I 39 :I 22	Patient L: I 29 :I 34 :I 5																				
Patient C: I 16 :I 31 :I 15	Patient M: I 23 :I 39 :I 16																				
Patient D: I 23 :I 40 :I 17	Patient N: I 29 :I 45 :I 16																				
Patient E: I 34 :I 42 :I 8	Patient O: I 29 :I 45 :I 16																				
Patient F: I 10 :I 42 :I 32	Patient P: I 34 :I 41 :I 7																				
Patient G: I 14 :I 44 :I 30	Patient Q: I 11 :I 14 :I 3																				
Patient H: I 32 :I 44 :I 12	Patient R: I 13 :I 39 :I 26																				
Patient I: I 19 :I 45 :I 26	Patient S: I 18 :I 45 :I 27																				
Patient J: I 26 :I 19 :I -7																					
Denominator:	<p>Eligible Population: Patients with total knee replacement procedures (Primary TKR Value Set, Revision TKR Value Set) occurring during a 12-month period for patients age 18 and older at the start of that period.</p> <p>Denominator: Patients within the eligible population whose functional status was measured by the Oxford Knee Score within 3 months preoperatively AND at 1 year (+/- 3 months) postoperatively</p> <p>*The measure of average change in function can only be calculated if both a pre-operative and post-operative PRO assessment are completed</p>																				
Exclusions:	None																				
Measure Type:	Patient Reported Outcome																				
Measure Domain:	Person and Caregiver-Centered Experience and Outcomes																				
High Priority Measure:	Yes (Patient Reported Outcome)																				
Collection Type:	MIPS CQMs Specifications																				
Rationale:	<p>We are adopting this measure because it measures an important patient reported outcome evaluating the functional status change from pre- to post-operative. Results can be used by clinicians in evaluating whether the patient's functional status has improved post-operatively. The MAP supported this measure for rulemaking and recognized that improvement in functional status is an important outcome to patients and was encouraged by the potential addition of more patient-reported outcome measures to the MIPS set.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>																				
<p>Comment: One commenter supported this new measure and applauded CMS for proposing to adopt four patient-reported outcome measures. They stated that patient-reported outcomes reflect issues that are important to patients and provide a valuable perspective on care that cannot be obtained from other data sources (for example, severity of pain, physical functioning). Several commenters are pleased this measure emphasizes the change in functional status and said that CMS should consider development of additional short and long-term outcomes measures for total joint procedures.</p> <p>Response: We thank the commenters for their support.</p> <p>Comment: One commenter recommended using the Patient-Reported Outcome Measurement Information System (PROMIS) as an alternative to the Oxford Knee Score (OKS) as the functional status assessment basis for this quality measure. A second commenter expressed concern that the OKS is a proprietary tool and that there are a number of validated tools available. Another commenter recommended the use of KOOS Jr and other potential measuring surveys to be available for use. The commenter also stated that KOOS Jr. and HOOS Jr. tools were selected as the preferred measurement instruments by the national orthopaedic specialty societies due to the ease of the tools.</p> <p>Response: We thank the commenters for their input. The measure steward has developed and tested this measure using the OKS tool to assess the change in functional status. We do not believe that the introduction of additional tools (PROMIS, KOOS Jr, HOOS Jr.) will add value to this quality measure. Rather, we believe that the addition tools introduce variability and would not provide a standardized tool to assess functional status. We do not own this measure and encourage the commenter to collaborate with the measure steward to expand the assessment tools. In addition, it would not be appropriate to include the</p>																					

Category	Description
	<p>HOOS Jr. survey since the patient population within this measure includes patients that have had a total knee replacement procedure. The HOOS Jr. is used to assess hip injuries and osteoarthritis.</p> <p>Comment: One commenter did not support the addition of this measure, stating that the validity, reliability, and informativeness of PROMs are uncertain.</p> <p>Response: Although we agree PROMs can be challenging to implement, the measure steward has fully tested this measure for validity and reliability to obtain NQF endorsement. PROMs have been deemed one of our priorities as it is important to ensure patients are engaged in their care and are an important component in evaluating outcomes. Therefore, we respectfully disagree that PROMs are not informative for improving patient outcomes and clinician quality performance.</p> <p>FINAL ACTION: We are finalizing the <i>Average Change in Functional Status Following Total Knee Replacement Surgery</i> measure as proposed for the 2019 Performance Period and future years.</p>

A.4. Average Change in Functional Status Following Lumbar Discectomy Laminotomy Surgery

A-4. Average Change in Functional Status Following Lumbar Discectomy Laminotomy Surgery																																																																		
Category	Description																																																																	
NQF #:	Not Applicable (NA)																																																																	
Quality #:	471																																																																	
Description:	For patients age 18 and older undergoing lumbar discectomy laminotomy surgery, the average change from pre-operative functional status to 3 months (6 to 20 weeks) post-operative functional status using the Oswestry Disability Index (ODI version 2.1a) patient reported outcome tool.																																																																	
Measure Steward:	Minnesota Community Measurement																																																																	
Numerator:	<p>The average change (preoperative to 3 months post-operative) in functional status for all patients in the denominator.</p> <p>There is not a traditional numerator for this measure; the measure is calculating the average change in functional status score from pre-operative to post-operative functional status score. The measure is NOT aiming for a numerator target value for a post-operative ODI score.</p> <p>The average change is calculated as follows: Change is first calculated for each patient and then changed scores are summed and then an average is determined. Measure calculation takes into account those patients that have an improvement and those patients whose function decreases post-operatively.</p> <p>For example:</p> <table><tr><td>Patient Pre-op ODI</td><td>:I</td><td>Post-op ODI</td><td>:I</td><td>Change in ODI</td></tr><tr><td>Patient A:</td><td>1 47</td><td>:I</td><td>18</td><td>:I</td><td>29</td></tr><tr><td>Patient B:</td><td>1 45</td><td>:I</td><td>52</td><td>:I</td><td>-7</td></tr><tr><td>Patient C:</td><td>1 56</td><td>:I</td><td>12</td><td>:I</td><td>44</td></tr><tr><td>Patient D:</td><td>1 62</td><td>:I</td><td>25</td><td>:I</td><td>37</td></tr><tr><td>Patient E:</td><td>1 42</td><td>:I</td><td>57</td><td>:I</td><td>-15</td></tr><tr><td>Patient F:</td><td>1 51</td><td>:I</td><td>10</td><td>:I</td><td>41</td></tr><tr><td>Patient G:</td><td>1 62</td><td>:I</td><td>25</td><td>:I</td><td>37</td></tr><tr><td>Patient H:</td><td>1 43</td><td>:I</td><td>20</td><td>:I</td><td>23</td></tr><tr><td>Patient I:</td><td>1 74</td><td>:I</td><td>35</td><td>:I</td><td>39</td></tr><tr><td>Patient J:</td><td>1 59</td><td>:I</td><td>23</td><td>:I</td><td>36</td></tr></table> <p>Average change in ODI 3 months post-op 26.4 points on a 100-point scale</p>	Patient Pre-op ODI	:I	Post-op ODI	:I	Change in ODI	Patient A:	1 47	:I	18	:I	29	Patient B:	1 45	:I	52	:I	-7	Patient C:	1 56	:I	12	:I	44	Patient D:	1 62	:I	25	:I	37	Patient E:	1 42	:I	57	:I	-15	Patient F:	1 51	:I	10	:I	41	Patient G:	1 62	:I	25	:I	37	Patient H:	1 43	:I	20	:I	23	Patient I:	1 74	:I	35	:I	39	Patient J:	1 59	:I	23	:I	36

Patient I:	1 74	:I	35	:I	39																																																													
Patient J:	1 59	:I	23	:I	36																																																													
Denominator:	<p>Eligible Population: Patients with lumbar discectomy laminotomy procedure (Single Disc-Lami Value Set) for a diagnosis of disc herniation (Disc Herniation Value Set)) occurring during a 12-month period for patients age 18 and older at the start of that period.</p> <p>Denominator: Patients within the eligible population whose functional status was measured by the Oswestry Disability Index, version 2.1a (ODI, v2.1a) within 3 months preoperatively AND at 3 months (6 to 20 weeks) postoperatively.</p> <p>*The measure of average change in function can only be calculated if both a pre-operative and post-operative PRO assessment are completed.</p>																																																																	
Exclusions:	<p>The following exclusions must be applied to the eligible population: Patient had any additional spine procedures performed on the same date as the lumbar discectomy laminotomy.</p>																																																																	
Measure Type:	Patient Reported Outcome																																																																	
Measure Domain:	Person and Caregiver-Centered Experience and Outcomes																																																																	
High Priority Measure:	Yes (Patient Reported Outcome)																																																																	
Collection Type:	MIPS CQMs Specifications																																																																	
Rationale:	<p>We are adopting this measure because it measures an important patient reported outcome evaluating the functional status change from pre- to post-operative. The results of the measure can be used by clinicians in evaluating whether the patient’s functional status has improved post-operatively. The MAP conditionally supported this measure pending NQF endorsement. While we agree with MAP that NQF endorsement of measures is preferred, NQF endorsement is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus. We believe this measure is evidence-based and is an important patient reported outcome.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>																																																																	
<p>Comment: One commenter supported this new measure and applauded CMS for proposing to adopt four patient-reported outcome measures. They stated that patient-reported outcomes reflect issues that are important to patients and provide a valuable perspective on care that cannot be obtained from other data sources (for example, severity of pain, physical functioning). Another commenter is pleased this measure emphasizes the change in functional status.</p> <p>Response: We thank the commenters for their support.</p> <p>Comment: One commenter recommended using the Patient-Reported Outcome Measurement Information System (PROMIS) as an alternative to the Oswestry Disability Index (ODI) as the functional status assessment basis for this quality measure.</p> <p>Response: The measure steward has developed and tested this measure using the ODI tool to assess the change in functional status. We do not believe that the PROMIS scale will add value to this quality measure. Rather, we believe that the addition of the PROMIS scale introduces variability and would not provide a standardized tool to assess functional status. We do not own this measure and encourage the commenter to collaborate with the measure steward to expand the assessment tools.</p> <p>Comment: One commenter did not support the addition of this measure, stating that the validity, reliability, and informativeness of PROMs are uncertain.</p>																																																																		

Category	Description
	<p>Response: Although we agree PROMs can be challenging to implement, the measure steward has fully tested this measure for validity and reliability to obtain NQF endorsement. PROMs have been deemed one of our priorities as it is important to ensure patients are engaged in their care and are an important component in evaluating outcomes. Therefore, we respectfully disagree that PROMs are not informative for improving patient outcomes and clinician quality performance.</p> <p>FINAL ACTION: We are finalizing the <i>Average Change in Functional Status Following Lumbar Discectomy Laminotomy Surgery</i> measure as proposed for the 2019 Performance Period and future years.</p>

A.5. Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture

Category	Description
NQF #:	Not Applicable (NA)
Quality #:	472
Description:	Percentage of female patients aged 50 to 64 without select risk factors for osteoporotic fracture who received an order for a dual-energy x-ray absorptiometry (DXA) scan during the measurement period.
Measure Steward:	Centers for Medicare & Medicaid Services
Numerator:	Female patients who received an order for at least one DXA scan in the measurement period.
Denominator:	Female patients ages 50 to 64 years with an encounter during the measurement period.
Exclusions:	<p>Exclude from the denominator patients with a combination of risk factors (as determined by age) or one of the independent risk factors:</p> <ul style="list-style-type: none"> • Ages: 50-54 (≥ 4 combo risk factors) or 1 independent risk factor • Ages: 55-59 (≥ 3 combo risk factors) or 1 independent risk factor • Ages: 60-64 (≥ 2 combo risk factors) or 1 independent risk factor <p>Combination risk factors (The following risk factors are all combination risk factors; they are grouped by when they occur in relation to the measurement period):</p> <p>The following risk factors may occur any time in the patient's history but must be active during the measurement period:</p> <ul style="list-style-type: none"> • White (race) • BMI ≤ 20 kg/m² (must be the first BMI of the measurement period) • Smoker (current during the measurement period) • Alcohol consumption ($>$ two units per day (one unit is 12 oz. of beer, 4 oz. of wine, or 1 oz. of liquor)) <p>The following risk factor may occur any time in the patient's history and must not start during the measurement period:</p> <ul style="list-style-type: none"> • Osteopenia <p>The following risk factors may occur at any time in the patient's history or during the measurement period:</p> <ul style="list-style-type: none"> • Rheumatoid arthritis • Hyperthyroidism • Malabsorption syndromes: celiac disease, inflammatory bowel disease, ulcerative colitis, Crohn's disease, cystic fibrosis, malabsorption • Chronic liver disease • Chronic malnutrition <p>The following risk factors may occur any time in the patient's history and do not need to be active at the start of the measurement period:</p> <ul style="list-style-type: none"> • Documentation of history of hip fracture in parent • Osteoporotic fracture • Glucocorticoids (≥ 5 mg/per day) [cumulative medication duration ≥ 90 days] <p>Independent risk factors (The following risk factors are all independent risk factors; they are grouped by when they occur in relation to the measurement period):</p> <p>The following risk factors may occur at any time in the patient's history and must not start during the measurement period:</p> <ul style="list-style-type: none"> • Osteoporosis <p>The following risk factors may occur at any time in the patient's history prior to the start of the measurement period, but do not need to be active during the measurement period:</p> <ul style="list-style-type: none"> • Gastric bypass • FRAX[R] 10-year probability of all major osteoporosis related fracture ≥ 9.3 percent • Aromatase inhibitors <p>The following risk factors may occur at any time in the patient's history or during the measurement period:</p> <ul style="list-style-type: none"> • Type 1 diabetes • End stage renal disease • Osteogenesis imperfecta • Ankylosing spondylitis • Psoriatic arthritis • Ehlers-Danlos syndrome • Cushing's syndrome • Hyperparathyroidism • Marfan syndrome • Lupus
Measure Type:	Process
Measure Domain:	Efficiency and Cost Reduction
High Priority measure:	Yes (Appropriate Use)
Collection Type:	eCQM Specifications
Rationale:	We are adopting this measure because it will serve as a counterbalance to the existing measure of appropriate use (that is, Screening for Osteoporosis for Women Aged 65-85 Years of Age (Quality ID #039)). This measure addresses the inappropriate use of DXA scans for

Category	Description
	<p>women age 50 – 64 years without risk factors for osteoporosis. The MAP recognized the need for early detection of osteoporosis but reiterated the importance of appropriate use of this screening technique and noted this measure could be complementary to the existing osteoporosis screening measure (Quality ID #039). The MAP recognized the potential need for a balancing measure to prevent the potential underuse of DXA scans. The MAP conditionally supported this measure pending NQF endorsement. While we agree with MAP that NQF endorsement of measures is preferred, it is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus. We believe this measure is evidence-based and is an important patient reported outcome.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>
Comment: One commenter supported the addition of this measure.	
Response: We thank the commenter for their support.	
Comment: One commenter expressed that clinicians may not be aware of the distinction between screening DXA scans and those appropriately performed as medically necessary follow-up care in a diagnosed individual to ascertain response to pharmacological interventions. The commenter urged CMS to clarify this distinction within its final rule and consider augmenting the pharmacologic therapy quality measure with a subpart that captures appropriate DXA re-testing to ascertain response to treatment. A second commenter urged CMS to defer implementing any quality measures that might deter osteoporosis screening until most men and women who are at heightened risk of fragility fractures receive testing and pharmacotherapy within the standard of care.	
Response: Thank you for your comment and support of the DXA screening measure. We affirm that the intent of this measure is to encourage screening in the population at greatest risk for osteoporosis and assess progress toward appropriate screening. We appreciate your suggestion for an additional measure on appropriate screening as a follow-up to pharmacologic therapy in the treatment of osteoporosis and will give consideration to developing such a measure. This measure includes a number of applicable risk factors that would remove the at-risk patient from the denominator. The intended patient population is not considered high risk where a DXA scan is not appropriate. This measure does not deter appropriate osteoporotic screening for patients that meet the risks factors.	
FINAL ACTION: We are finalizing the <i>Appropriate Use of DXA Scans in Women Under 65 Years Who Do Not Meet the Risk Factor Profile for Osteoporotic Fracture</i> measure as proposed for the 2019 Performance Period and future years.	

A.6. Average Change in Leg Pain Following Lumbar Spine Fusion Surgery

Category	Description										
NQF #:	Not Applicable (NA)										
Quality #:	473										
Description:	For patients age 18 and older undergoing lumbar spine fusion surgery, the average change from pre-operative leg pain to 1 year (9 to 15 months) post-operative leg pain using the Visual Analog Scale (VAS) patient reported outcome tool.										
Measure Steward:	Minnesota Community Measurement										
Numerator:	<p>The average change (preoperative to 1 year post-operative) in leg pain for all patients in the denominator.</p> <p>There is not a traditional numerator for this measure; the measure is calculating the average change in leg pain score from pre-operative to post-operative leg pain score. The measure is NOT aiming for a numerator target value for a post-operative pain score.</p> <p>The average change is calculated as follows: Change is first calculated for each patient and then changed scores are summed and then an average is determined. Measure calculation takes into account those patients that have an improvement and those patients whose pain increases post-operatively. For example: Patient I: Pre-op VAS I: Post-op VAS I:(Pre-op minus Post-op)</p> <table border="0"> <tr> <td>Patient A: I: 8.5 I: 3.5 I: 5.0</td> <td>Patient F I: 7.5 I: 1.5 I: 6.0</td> </tr> <tr> <td>Patient B: I: 9.0 I: 2.5 I: 6.5</td> <td>Patient G I: 9.0 I: 4.5 I: 4.5</td> </tr> <tr> <td>Patient C: I: 7.0 I: 0.5 I: 6.5</td> <td>Patient H I: 5.5 I: 7.5 I: -2.0</td> </tr> <tr> <td>Patient D: I: 6.5 I: 8.0 I: -1.5</td> <td>Patient I I: 9.0 I: 5.0 I: 4.0</td> </tr> <tr> <td>Patient E I: 8.5 I: 2.0 I: 6.5</td> <td>Patient J I: 7.0 I: 2.5 I: 4.5</td> </tr> </table> <p>Average change in VAS points 4.0 Average change in leg pain 1 year post-op 4.0 points on a 10 point scale.</p>	Patient A: I: 8.5 I: 3.5 I: 5.0	Patient F I: 7.5 I: 1.5 I: 6.0	Patient B: I: 9.0 I: 2.5 I: 6.5	Patient G I: 9.0 I: 4.5 I: 4.5	Patient C: I: 7.0 I: 0.5 I: 6.5	Patient H I: 5.5 I: 7.5 I: -2.0	Patient D: I: 6.5 I: 8.0 I: -1.5	Patient I I: 9.0 I: 5.0 I: 4.0	Patient E I: 8.5 I: 2.0 I: 6.5	Patient J I: 7.0 I: 2.5 I: 4.5
Patient A: I: 8.5 I: 3.5 I: 5.0	Patient F I: 7.5 I: 1.5 I: 6.0										
Patient B: I: 9.0 I: 2.5 I: 6.5	Patient G I: 9.0 I: 4.5 I: 4.5										
Patient C: I: 7.0 I: 0.5 I: 6.5	Patient H I: 5.5 I: 7.5 I: -2.0										
Patient D: I: 6.5 I: 8.0 I: -1.5	Patient I I: 9.0 I: 5.0 I: 4.0										
Patient E I: 8.5 I: 2.0 I: 6.5	Patient J I: 7.0 I: 2.5 I: 4.5										
Denominator:	<p>Eligible Population: Patients with lumbar spine fusion procedures (Arthrodesis Value Set) occurring during a 12-month period for patients age 18 and older at the start of that period.</p> <p>Denominator: Patients within the eligible population whose leg pain was measured by the Visual Analog Scale (VAS) within 3 months preoperatively AND at 1 year (+/- 3 months) postoperatively.</p> <p>*The measure of average change in function can only be calculated if both a pre-operative and post-operative PRO assessment are completed</p>										
Exclusions:	<p>The following exclusions must be applied to the eligible population: Patient had cancer (Spine Cancer Value Set), fracture (Spine Fracture Value Set) or infection (Spine Infection Value Set) related to the spine. Patient had idiopathic or congenital scoliosis (Congenital Scoliosis Value Set)</p>										
Measure Type:	Patient Reported Outcome										
Measure Domain:	Person and Caregiver-Centered Experience and Outcomes										
High priority measure:	Yes (Patient Reported Outcome)										
Collection Type:	MIPS CQMs Specifications										
Rationale:	<p>We are adopting this measure because it evaluates the management of pain from pre- to post-operative, which represents an important patient reported outcome. The results can be used by clinicians in evaluating whether the patient's pain has reduced post-operatively. The MAP conditionally supported this measure pending NQF endorsement. While we agree with MAP that NQF endorsement of measures is preferred, it is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus. We believe this measure is evidence-based and is an important patient reported outcome.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>										
<p>Comment: One commenter supported this new measure and applauded CMS for proposing to adopt four patient-reported outcome measures. The commenter stated that patient-reported outcomes reflect issues that are important to patients and provide a valuable perspective on care that cannot be obtained from other data sources (for example, severity of pain, physical functioning).</p> <p>Response: We thank the commenter for their support.</p> <p>Comment: One commenter did not support the addition of this measure, stating that the validity, reliability, and informativeness of PROMs are uncertain.</p> <p>Response: Although we agree PROMs can be challenging to implement, the measure steward has fully tested this measure for validity and reliability to obtain NQF endorsement. PROMs have been deemed one of our priorities as it is important to ensure patients are engaged in their care and are an important component in evaluating outcomes. Therefore, we respectfully disagree that PROMs are not informative for improving patient outcomes and clinician quality performance.</p> <p>FINAL ACTION: We are finalizing the <i>Average Change in Leg Pain Following Lumbar Spine Fusion Surgery</i> measure as proposed for the 2019 Performance Period and future years.</p>											

A.7. Ischemic Vascular Disease Use of Aspirin or Anti-platelet Medication

Category	Description
NQF #:	Not Applicable (NA)
Quality #:	Not Applicable (N/A)
Description:	The percentage of patients 18-75 years of age who had a diagnosis of ischemic vascular disease (IVD) and were on daily aspirin or anti-platelet medication, unless allowed contraindications or exceptions are present.
Measure Steward:	Minnesota Community Measurement
Numerator:	Denominator patients with documentation that the patient was on daily aspirin or anti-platelet medication during the measurement period, unless allowed contraindications or exceptions are present.
Denominator:	18 years or older at the start of the measurement period AND less than 76 years at the end of the measurement period. AND Patient had a diagnosis of ischemic vascular disease (Ischemic Vascular Disease Value Set) with any contact during the current or prior measurement period OR had ischemic vascular disease (Ischemic Vascular Disease Value Set) present on an active problem list at any time during the measurement period. AND At least one established patient office visit (Established Pt Diabetes & Vasc Value Set) for any reason during the measurement period
Exclusions:	The following exclusions are allowed to be applied to the eligible population: <ul style="list-style-type: none"> • Patient was a permanent nursing home resident at any time during the measurement period. • Patient was in hospice or receiving palliative care at any time during the measurement period. • Patient died prior to the end of the measurement period. • Patient had only urgent care visits during the measurement period.
Measure Type:	Process
Measure Domain:	Effective Clinical Care
High priority measure:	No
Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Rationale:	<p>We proposed this measure because the measure exclusions are more appropriate than those in the currently adopted Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antithrombotic (Quality ID #204) measure. The measure accounts for history of gastrointestinal bleeding, intracranial bleeding, bleeding disorder, allergy to aspirin or anti-platelets, or use of non-steroidal anti-inflammatory agents. The MAP acknowledged both that clinicians may still report Aspirin or Anti-platelet Medication measures separately from the composite to drive quality improvement. The MAP conditionally supported this measure with the condition that there are no competing measures in the program. We refer readers to Table C where we are removing Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antithrombotic (Quality ID #204).</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>
<p>Comment: A commenter recommended utilizing the Core Quality Measure Collaborative (CQMC) to evaluate both the Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet measure and the measure CMS proposed to replace it with a new measure: Ischemic Vascular Disease: Use of Aspirin or Antiplatelet Medication, during their maintenance review of the ACO/PMH/PC Core Measure Set. This will allow payers, clinicians, and other stakeholders to weigh in on the measures' exclusion criteria and other characteristics. Another commenter encouraged CMS to continue alignment of the MIPS measure set with those recommended by the CQMC. Another commenter opposed the proposed adoption of this measure because they believe that it is already captured in the Q441: Ischemic Vascular Disease (IVD) All or None Outcome Measure (Optimal Control) measure and recommended not including such a measure in the program where it could displace reporting of the higher-value composite measure.</p> <p>Response: We appreciate the suggestion to allow stakeholders to weigh in on the exclusion criteria; however, we do not steward either of the measures and may not have the flexibility to revise the measures based on payers, clinicians or other stakeholders' feedback. Engaging the CQMC is beneficial to obtaining stakeholder feedback, but we encourage the commenter to provide this feedback to the CQMC. We are aware that this new measure is captured in the composite measure Q441 and that the composite measure is more robust. Although we believe Q441 may be burdensome to some eligible clinicians, we also believe it is a more meaningful measure than this new IVD measure. Therefore, to be consistent with our policy to remove measures that are duplicative to other measures and to ensure measures are more meaningful, we have decided to not finalize inclusion of this new IVD measure.</p> <p>FINAL ACTION: We are not finalizing the <i>Ischemic Vascular Disease Use of Aspirin or Anti-platelet Medication</i> measure as proposed for the 2019 Performance Period.</p>	

A.8. Zoster (Shingles) Vaccination

Category	Description
NQF #:	Not Applicable (NA)
Quality #:	474
Description:	The percentage of patients 50 years of age and older who have a Varicella Zoster (shingles) vaccination.
Measure Steward:	PPRNet
Numerator:	Patients with a shingles vaccine ever recorded.
Denominator:	Patients 50 years of age and older.
Exclusions:	None
Measure Type:	Process
Measure Domain:	Community/Population Health
High priority measure:	No
Collection Type:	MIPS CQMs Specifications
Rationale:	<p>We are adopting this measure because there are no measures currently in MIPS that address shingles vaccination for patients 50 years and older as recommended by the CDC. The MAP concluded that this measure would address the important topic of adult immunization. It discussed the new guidelines under development for the Zoster vaccination that could impact the amount of doses, the age of administration, and the specific vaccine that is used, but also noted that guidelines are constantly evolving and measures should be routinely updated based on changing guidelines. The MAP conditionally supported this measure pending NQF endorsement, and specifically requested evaluating the measure to ensure it has appropriate exclusions and reflects the most current CDC guidelines given the concerns about the cost of the vaccine and potential concerns about administering to immunocompromised patients. While we agree with MAP that NQF endorsement of measures is preferred, it is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus. We believe this measure is evidence-based and is an important patient reported outcome.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>
<p>Comment: One commenter did not support the proposed adoption of this measure because it needs to be updated to reflect the most recent clinical guidelines.</p> <p>Response: The measure steward has aligned this measure with the most current clinical guidelines and it will be implemented as such. As indicated in our rationale, the measure will address the impacts to the amount of doses, the age of administration and the specific vaccine utilized. This measure addresses an important gap in adult immunization.</p> <p>Comment: Several commenters noted that the proposed rule rationale of “60 years and older” should be “50 years and older.”</p> <p>Response: We thank the commenters for their concerns regarding the age criteria with the rationale. The correct age was included in the description and denominator within the proposed rule, but did not align with the rationale. We agree with the denominator including patients over the age of 50 years and aligned the rationale with the measure’s age criteria.</p> <p>Comment: One commenter supported the proposed new measure for Zoster (Shingles) Vaccination. The commenter also supported broader adoption of a herpes zoster measure across specialty sets to reduce the number of missed immunization opportunities for this debilitating condition. The commenter supported the alignment of reporting mechanisms and believed doing so will strengthen and enhance the development and implementation of adult immunization quality measures.</p> <p>Response: We thank the commenter for their support of the new measure, Zoster (Shingles) Vaccination.</p> <p>FINAL ACTION: We are finalizing the <i>Zoster (Shingles) Vaccination</i> measure as proposed for the 2019 Performance Period and future years. The rationale is updated to state “patients 50 years and older” which aligns with the description and denominator age criteria.</p>	

A.9. HIV Screening

Category	Description
NQF #:	Not Applicable (NA)
Quality #:	475
Description:	Percentage of patients 15-65 years of age who have ever been tested for human immunodeficiency virus (HIV).
Measure Steward:	Centers for Disease Control and Prevention
Numerator:	Patients with documentation of the occurrence of an HIV test between their 15th and 66th birthdays and before the end of the measurement period.
Denominator:	Patients 15 to 65 years of age who had an outpatient visit during the measurement period.
Exclusions:	Patients diagnosed with HIV prior to the start of the measurement period.
Measure Type:	Process
Measure Domain:	Community/Population Health
High priority measure:	No
Collection Type:	eCQM Specifications
Rationale:	<p>We are adopting this measure because HIV screening is a national and global priority. While there are three currently adopted HIV measures in MIPS, they do not include screening the general population. The MAP acknowledged the importance of HIV screening from a population health perspective, but also questioned whether encouraging HIV screening through the MIPS program is the most effective strategy for improving this population health goal. It also expressed concern about how this measure under consideration identified individuals who may have a HIV screening in the community. Additionally, several MAP members expressed concern regarding the specifications requiring one time lifetime screening. The MAP conditionally supported this measure pending NQF endorsement. While we agree with MAP that NQF endorsement of measures is preferred, it is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus. We believe this measure is evidence-based and is an important patient reported outcome.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=86972.</p>
<p>Comment: One commenter did not support the proposed adoption of this measure because they stated that there is no demonstrated performance gap (measure testing results showed very high performance overall) and the measure still needs to be tested at the clinician-level.</p> <p>Response: We believe it is important to implement an HIV screening measure as it addresses an important national and global priority. This measure has been developed as an eCQM Specification and should have little burden in the submission of this measure. The version of this measure proposed has been tested at the clinician-level. The measure steward developed and tested a previous version of this measure at the community center-level. The NQF Health and Well-Being 2015-2017 Committee reviewed this facility-level version of the measure and voted to pass the measure on evidence and performance gap, but decided the measure did not meet the scientific acceptability criteria. The NQF standing committee noted that when this previous version of the measure was tested at the facility-level a performance gap was demonstrated, performance at four community health centers ranged from 20.6 to 31.1 percent and performance at a fifth community health center serving a high-risk population was 65.3 percent (NQF, Health and Well-Being 2015-2017: Technical Report, April 17, 2017, http://www.qualityforum.org/Projects/h/Health_and_Well_Being_2015-2017/Final_Report.aspx). Since then, the measure steward modified the measure and tested it at the clinician-level. As we indicated in our proposal, the MAP reviewed this clinician-level version of the measure in 2018 and conditionally supported it pending NQF review and endorsement. The steward plans to seek NQF endorsement on this clinician-level measure. We believe implementing this measure at the clinician-level will raise awareness and improve patient care leading to improvement in population health.</p> <p>FINAL ACTION: We are finalizing the <i>HIV Screening</i> measure as proposed for the 2019 Performance Period and future years.</p>	

A.10. Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls

Category	Description
NQF #:	0101
Quality #:	Not Applicable (N/A)
Description:	<p>This is a clinical process measure that assesses falls prevention in older adults. The measure has three rates:</p> <p>Screening for Future Fall Risk: Percentage of patients aged 65 years and older who were screened for future fall risk at least once within 12 months.</p> <p>Falls Risk Assessment: Percentage of patients aged 65 years and older with a history of falls who had a risk assessment for falls completed within 12 months.</p> <p>Plan of Care for Falls: Percentage of patients aged 65 years and older with a history of falls who had a plan of care for falls documented within 12 months.</p>
Measure Steward:	National Committee for Quality Assurance
Numerator:	<p>This measure has three rates. The numerators for the three rates are as follows:</p> <p>A) Screening for Future Fall Risk: Patients who were screened for future fall* risk** at last once within 12 months.</p> <p>B) Falls Risk Assessment: Patients who had a risk assessment*** for falls completed within 12 months.</p> <p>C) Plan of Care for Falls: Patients with a plan of care**** for falls documented within 12 months.</p> <p>*A fall is defined as a sudden, unintentional change in position causing an individual to land at a lower level, on an object, the floor, or the ground, other than as a consequence of a sudden onset of paralysis, epileptic seizure, or overwhelming external force.</p> <p>**Risk of future falls is defined as having had had 2 or more falls in the past year or any fall with injury in the past year.</p> <p>***Risk assessment is comprised of balance/gait assessment AND one or more of the following assessments: postural blood pressure, vision, home fall hazards, and documentation on whether medications are a contributing factor or not to falls within the past 12 months.</p> <p>****Plan of care must include consideration of vitamin D supplementation AND balance, strength and gait training.</p>
Denominator:	<p>A) Screening for Future Fall Risk: All patients aged 65 years and older seen by an eligible provider in the past year.</p> <p>B & C) Falls Risk Assessment & Plan of Care for Falls: All patients aged 65 years and older seen by an eligible provider in the past year with a history of falls (history of falls is defined as 2 or more falls in the past year or any fall with injury in the past year).</p>
Exclusions:	Patients who have documentation of medical reason(s) for not screening for future fall risk, undergoing a risk-assessment or having a plan of care (for example, patient is not ambulatory) are excluded from this measure.
Measure Type:	Process
Measure Domain:	Patient Safety
High Priority Measure:	Yes
Collection Type:	Medicare Part B Claims Measure Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Rationale:	<p>We are adopting this measure because it is a combined version of three of the currently adopted measures 154: Falls: Risk Assessment, 155: Falls: Plan of Care and 318: Falls: Screening for Future Fall Risk. The new combined Falls measure (based on specifications in NQF 0101) is more robust and will include strata components for Future Falls Risk, Falls Risk Assessment, and Falls Risk Plan of Care which creates a more comprehensive screening measure. As noted in Table C, we are proposing to remove 154: Falls: Risk Assessment, 155: Falls: Plan of Care and 318: Falls: Screening for Future Fall Risk because they will be subsumed by this new measure. While we note that has not been put forth through the MAP for consideration in MIPS, the three individual measures have been NQF endorsed as one measure.</p>
<p>Comment: We received a number of comments opposing the new composite measure. Comments included a need for more clinical review, that vendors need time to develop and certify the respective replacement measures, and that CMS does not describe a benchmark for the composite measure. Several commenters were in support of the new composite measure stating that that it is a more robust and more comprehensive screening measure.</p> <p>Response: We thank all of the commenters for expressing the opposition of combining three measures to create a composite measure. We agree with the feedback provided and will postpone the implementation of the Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls measure until the measure can be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population.</p> <p>FINAL ACTION: We are not finalizing the <i>Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls</i> measure for the 2019 Performance Period.</p>	

TABLE Group B: Finalized New and Modified MIPS Specialty Measure Sets for the 2021 MIPS Payment Year and Future Years

Note: In the CY 2019 PFS proposed rule (83 FR 35704), we proposed to modify the specialty measure sets below based upon review of updates made to existing quality measure specifications, the proposal of adding new measures for inclusion in MIPS, and the feedback provided by specialty societies. In the first column, existing measures with substantive changes are noted with an asterisk (*), core measures that align with Core Quality Measure Collaborative (CQMC) core measure set(s) are noted with the symbol (§) and high priority measures are noted with an exclamation point (!). In addition, the Indicator column includes a “high priority type” in parentheses after each high priority indicator (!) to fully represent the regulatory definition of high priority measures.

As discussed in section III.I.3.h.(2)(b)(i) of this final rule, we are amending the definition of high priority at §414.1305 to include opioid-related measures. We define high priority measure to mean an outcome, appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure. Outcome measures include outcome, intermediate outcome, and patient reported outcome. A high priority indicator (an exclamation point (!)) in the Indicator column has been added for all opioid-related measures.

The following specialty measure sets have been excluded from this final rule, because we did not propose any changes to these sets: Allergy/Immunology, Electro-Physiology Cardiac Specialist, Plastic Surgery, Interventional Radiology, Dentistry and Hospitalists. Therefore, we refer readers to these finalized specialty sets in the CY 2018 Quality Payment Program final rule (82 FR 53976 through 54146). Note: In the proposed rule, we inadvertently included the Dentistry specialty set even though no changes were proposed for this specialty set; therefore, we removed the Dentistry specialty set from this final rule because we did not receive any comments specific to the Dentistry specialty set from previous final rules or the proposed rule.

B.1. Anesthesiology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Anesthesiology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 426 and 427.

B.1. Anesthesiology

MEASURES FINALIZED FOR INCLUSION

MEASURES FINALIZED FOR INCLUSION									
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description		Measure Steward
	0236	044	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Coronary Artery Bypass Graft (CABG): Preoperative Beta-Blocker in Patients with Isolated CABG Surgery: Percentage of isolated Coronary Artery Bypass Graft (CABG) surgeries for patients aged 18 years and older who received a beta-blocker within 24 hours prior to surgical incision.		Centers for Medicare & Medicaid Services
! (Patient Safety)	N/A	076	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Patient Safety	Prevention of Central Venous Catheter (CVC)-Related Bloodstream Infections: Percentage of patients, regardless of age, who undergo central venous catheter (CVC) insertion for whom CVC was inserted with all elements of maximal sterile barrier technique, hand hygiene, skin preparation and, if ultrasound is used, sterile ultrasound techniques followed.		American Society of Anesthesiologists
! (Outcome)	N/A	404	N/A	MIPS CQMs Specifications	Intermediate Outcome	Effective Clinical Care	Anesthesiology Smoking Abstinence: The percentage of current smokers who abstain from cigarettes prior to anesthesia on the day of elective surgery or procedure.		American Society of Anesthesiologists
! (Outcome)	2681	424	N/A	MIPS CQMs Specifications	Outcome	Patient Safety	Perioperative Temperature Management: Percentage of patients, regardless of age, who undergo surgical or therapeutic procedures under general or neuraxial anesthesia of 60 minutes duration or longer for whom at least one body temperature greater than or equal to 35.5 degrees Celsius (or 95.9 degrees Fahrenheit) was achieved within the 30 minutes immediately before or the 15 minutes immediately after anesthesia end time.		American Society of Anesthesiologists
! (Patient Safety)	N/A	430	N/A	MIPS CQMs Specifications	Process	Patient Safety	Prevention of Post-Operative Nausea and Vomiting (PONV) – Combination Therapy: Percentage of patients, aged 18 years and older, who undergo a procedure under an inhalational general anesthetic, AND who have three or more risk factors for post-operative nausea and vomiting (PONV), who receive combination therapy consisting of at least two prophylactic pharmacologic antiemetic agents of different classes preoperatively or intraoperatively.		American Society of Anesthesiologists
		N/A	463	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Prevention of Post-Operative Vomiting (POV) - Combination Therapy (Pediatrics): Percentage of patients aged 3 through 17 years of age, who undergo a procedure under general anesthesia in which an inhalational anesthetic is used for maintenance AND who have two or more risk factors for post-operative vomiting (POV), who receive combination therapy consisting of at least two prophylactic pharmacologic anti-emetic agents of different classes preoperatively and/or intraoperatively.	American Society of Anesthesiologists

We did not receive specific comments regarding the measures included in this specialty measure set.

FINAL ACTION: We are finalizing the *Anesthesiology Specialty Measure Set* as proposed for the 2019 Performance Period and future years.

B.1. Anesthesiology (continued)

MEASURES FINALIZED FOR REMOVAL

Note: In this final rule, the following measure(s) are removed from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A	426	N/A	MIPS CQMs Specifications	Process	Communication and Care Coordination	Post-Anesthetic Transfer of Care Measure: Procedure Room to a Post Anesthesia Care Unit (PACU): Percentage of patients, regardless of age, who are under the care of an anesthesia practitioner and are admitted to a PACU or other non-ICU location in which a post-anesthetic formal transfer of care protocol or checklist which includes the key transfer of care elements is utilized.	American Society of Anesthesiologists	This measure is removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future.”
N/A	427	N/A	MIPS CQMs Specifications	Process	Communication and Care Coordination	Post-Anesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU): Percentage of patients, regardless of age, who undergo a procedure under anesthesia and are admitted to an Intensive Care Unit (ICU) directly from the anesthetizing location, who have a documented use of a checklist or protocol for the transfer of care from the responsible anesthesia practitioner to the responsible ICU team or team member.	American Society of Anesthesiologists	This measure is removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”

We did not receive specific comments regarding the proposed removal of measures from this specialty measure set.

FINAL ACTION: We are finalizing the removal of measures from the *Anesthesiology Specialty Measure Set* as proposed for the 2019 Performance Period and future years.

B.2. Cardiology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Cardiology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 204 and 373.

							cardiovascular disease (ASCVD); OR • Adults aged ≥21 years who have ever had a fasting or direct low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL; OR • Adults aged 40-75 years with a diagnosis of diabetes with a fasting or direct LDL-C level of 70-189 mg/dL.		
! (Outcome)	N/A	441	N/A	MIPS CQMs Specifications	Intermediate Outcome	Effective Clinical Care	Ischemic Vascular Disease All or None Outcome Measure (Optimal Control): The IVD All-or-None Measure is one outcome measure (optimal control). The measure contains four goals. All four goals within a measure must be reached in order to meet that measure. The numerator for the all-or-none measure should be collected from the organization's total IVD denominator. All-or-None Outcome Measure (Optimal Control) - Using the IVD denominator optimal results include: <ul style="list-style-type: none">• Most recent blood pressure (BP) measurement is less than or equal to 140/90 mm Hg -- And• Most recent tobacco status is Tobacco Free -- And• Daily Aspirin or Other Antiplatelet Unless Contraindicated -- And• Statin Use Unless Contraindicated	Wisconsin Collaborative for Healthcare Quality (WCHQ)	
§	0071	442	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Persistent Beta Blocker Treatment After a Heart Attack: The percentage of patients 18 years of age and older during the measurement year who were hospitalized and discharged from July 1 of the year prior to the measurement year to June 30 of the measurement year with a diagnosis of acute myocardial infarction (AMI) and who received were prescribed persistent beta-blocker treatment for 6 months after discharge.	National Committee for Quality Assurance	
<p>Comment: One commenter supported the inclusion of measure Q243: Cardiac Rehabilitation Patient Referral from an Outpatient Setting measure in this measure set. The commenter noted that the inclusion of the performance measure, in the MIPS Cardiology Specialty Measure Sets is a first and important step in improving physician referral habits; however, the commenter stated that it will also be important to include the corresponding measure, Cardiac Rehabilitation Patient Referral from an Inpatient Setting as well.</p> <p>Response: We encourage the commenter to work with measures' developers to submit new measures through the Call for Measures process to include the measure related to the inpatient setting.</p> <p>FINAL ACTION: We are finalizing the <i>Cardiology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years with the exception of Ischemic Vascular Disease Use of Aspirin or Anti-platelet Medication. We are no longer finalizing the inclusion of this measure as it is duplicative of a component within Q441: Ischemic Vascular Disease All or None Outcome Measure (Optimal Control).</p>									

B.2. Cardiology

MEASURES FINALIZED FOR REMOVAL

Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
0068	204	CMS164v7	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications	Process	Effective Clinical Care	Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet: Percentage of patients 18 years of age and older who were diagnosed with acute myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI) in the 12 months prior to the measurement period, or who had an active diagnosis of ischemic vascular disease (IVD) during the measurement period, and who had documentation of use of aspirin or another antiplatelet during the measurement period.	National Committee for Quality Assurance	This measure is removed from the 2019 program based on the detailed below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”
N/A	373	CMS65v8	eCQM Specifications	Intermediate Outcome	Effective Clinical Care	Hypertension: Improvement in Blood Pressure: Percentage of patients aged 18-85 years of age with a diagnosis of hypertension whose blood pressure improved during the measurement period.	Centers for Medicare & Medicaid Services	This measure is removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”

We did not receive specific comments regarding the proposed removal of measures from this specialty measure set.

FINAL ACTION: We are finalizing the removal of measures from the *Cardiology Specialty Measure Set* as proposed for the 2019 Performance Period and future years.

B.3. Gastroenterology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Gastroenterology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we are not finalizing our proposal to remove Quality ID: 185 (MIPS CQMs Specifications) from the specialty set, but we are finalizing our proposal to remove Quality ID: 185 (Medicare Part B Claims Measure Specifications). Therefore, Q185 is now included in this measure set table for the final rule with MIPS CQMs Specifications as the collection type.

							counseling if identified as an unhealthy alcohol user.		
	§ !	N/A	439	N/A	MIPS CQMs Specifications	Efficiency	Efficiency and Cost Reduction	Age Appropriate Screening Colonoscopy: The percentage of patients greater than 85 years of age who received a screening colonoscopy from January 1 to December 31.	American Gastroenterological Association

Comment: A few commenters did not support removal of measure Q185: Colonoscopy Interval for Patients with a History of Adenomatous Polyps – Avoidance of Inappropriate Use. One commenter noted that updated guidelines on the appropriate follow-up interval for patients with a history of adenomatous polyps are set to be released in the near future. This commenter noted that it is likely that the measure specifications will be updated at that point, which may alter clinician performance. This commenter recommended that CMS retain the measure in MIPS until it is able to review other stakeholder concerns about measure performance, and that CMS work with the measure developer to update the MIPS measure specifications when new guidelines are released.

Response: We agree that updated guidelines could affect the performance of this measure causing the measure to have a substantive change, and therefore, may no longer have a benchmark that is considered to be topped out. We note this measure shows a 97.7 percent average performance for Medicare Part B Claims Measure Specifications while the MIPS CQMs Specification (registry) version shows less than 97 percent average performance rate. Based on our extremely topped out measure removal policy, we are only finalizing the removal of this measure from the Medicare Part B Claims Measure Specification collection type for the 2019 performance period. We will not finalize the removal of MIPS CQM s Specification collection type. We will work with the measure steward to update for the new clinical guidelines once they are released and continue to monitor the performance of the MIPS CQM Measure Specification in the future.

Comment: One commenter expressed concern about the scoring methodology of measure Q343: Screening Colonoscopy Adenoma Detection Rate as a performance rate near 100 percent would not indicate better care. The commenter stated that in a typical population about 25 percent of colonoscopies should find an adenoma to set a benchmark of 25 percent for all populations. From a clinical and performance measure perspective, while it may be true that a 0 percent or 5 percent rate would be worrisome, the commenter stated there is no reason to believe that a rate of 20 percent is worse than 30 percent or that 40 percent is better than 35 percent or 45 percent. A rate of 90 percent would be suspicious.

Response: We will explore options to alter the scoring methodology to assign higher deciles to the 25th to 35th percentiles or consider removing the measure in future rulemaking. We encourage measure stewards to explore options that address appropriate adenoma detection and submit measures for consideration to the annual Call for Measures.

Comment: One commenter indicated that the measure steward listed in the proposed rule for measure Q343: Screening Colonoscopy Adenoma Detection Rate is incorrect and asked that the measure steward be corrected.

Response: We agree with the commenter that the measure steward was incorrectly listed as the American Gastroenterological Association. This has been updated to the American Society for Gastrointestinal Endoscopy.

FINAL ACTION: We are finalizing the *Gastroenterology Specialty Measure Set* as proposed for the 2019 Performance Period and future years. As noted above, we are not finalizing the removal of measure Q185 (MIPS CQM specification) from the *Gastroenterology Specialty Measure Set* for the 2019 Performance Period and future years; therefore, measure Q185 has been added back into this measure specialty set.

B.4. Dermatology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Dermatology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measure from the specialty set: Quality ID: 224.

American Academy of Dermatology
<p>Comment: One commenter was pleased this measure set includes measures Q337: Psoriasis: Tuberculosis (TB) Prevention for Patients with Psoriasis, Psoriatic Arthritis and Rheumatoid Arthritis on a Biological Immune Response Modifier and Q410: Psoriasis Clinical Response to Systemic Medication. Inclusion of these measures will advance psoriatic disease care and help to ensure that clinicians are accountable for meaningful measures that have the greatest impact on patient care.</p> <p>A second commenter appreciated that CMS accepted its recommendations to update the description and expand the measure numerator and denominator.</p> <p>Response: We thank the commenter for their support of these measures.</p> <p>FINAL ACTION: We are finalizing the <i>Dermatology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>									

B.4 Dermatology (continued)

MEASURES FINALIZED FOR REMOVAL

Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A	224	N/A	MIPS CQMs Specifications	Process	Efficiency and Cost Reduction	Melanoma: Avoidance of Overutilization of Imaging Studies: Percentage of patients, regardless of age, with a current diagnosis of stage 0 through IIC melanoma or a history of melanoma of any stage, without signs or symptoms suggesting systemic spread, seen for an office visit during the one-year measurement period, for whom no diagnostic imaging studies were ordered.	American Academy of Dermatology	This measure is removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”

We did not receive specific comments regarding the proposed removal of measures from this specialty measure set.

FINAL ACTION: We are finalizing the removal of measures from the *Dermatology Measure Set* as proposed for the 2019 Performance Period and future years.

B.5. Family Medicine

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Family Medicine specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 163, 204, 334, 373, and 447.

<p>Comment: One commenter indicated that opportunities to assess the immunization status of Medicare beneficiaries for should be done by the range of clinicians who care for them, including primary care and specialty clinicians. Taking advantage of each and every patient encounter to ensure that counseling and education on vaccines, based on their age and health status, and a strong clinician recommendation have been found to improve the likelihood of a patient being immunized. The commenter supported the inclusion of measure Q110: Preventive Care and Screening Influenza Immunization and measure Q111: Pneumococcal Vaccination Status for Older Adults into a number of primary care and specialty quality measure sets. Prioritizing quality measures around immunizations will help close existing measure gaps, improve upon immunization rates and health outcomes for the millions of Medicare beneficiaries. A second commenter supported inclusion of measures Q110, Q111, Q394: Immunizations for Adolescents.</p> <p>Response: We thank the commenters for their support of measures Q110, Q111, and Q394.</p> <p>FINAL ACTION: We are finalizing the <i>Family Medicine Specialty Measure Set</i> as proposed for the 2019 Performance Period and future year with the exception of the following newly proposed measures: Ischemic Vascular Disease Use of Aspirin or Anti-platelet Medication and Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of this IVD measure as it is duplicative of a component within Q441: Ischemic Vascular Disease All or None Outcome Measure (Optimal Control). We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. In addition, as noted in our responses to public comments in Table C, measures Q048, Q154, Q155, and Q318 are not finalized for removal from this measure set as proposed; therefore, they will be retained in this measure set for the 2019 Performance Period and future years.</p>									

B.5. Family Medicine

We did not receive specific comments regarding the proposed removal of measures from this specialty measure set.

FINAL ACTION: We are finalizing the removal of measures from the *Family Medicine Specialty Measure Set* as proposed for the 2019 Performance Period and future years. However, as noted in our responses to public comments in Table C, we are not finalizing the following measures for removal from this measure set: Q048, Q154, Q155, and Q318.

B.6. Internal Medicine

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Internal Medicine specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 163, 204, 276, 278, 334, 373, and 447.

MEASURES FINALIZED FOR INCLUSION								
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward
Response: We thank the commenter for their support.								
<p>FINAL ACTION: We are finalizing the <i>Internal Medicine Specialty Measure Set</i> as proposed for the 2019 Performance Period and future year with the exception of the following newly proposed measures: Ischemic Vascular Disease Use of Aspirin or Anti-platelet Medication and Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of this IVD measure as it is duplicative of a component within Q441: Ischemic Vascular Disease All or None Outcome Measure (Optimal Control). We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. In addition, as noted in our responses to public comments in Table C, measures Q048, Q154, Q155, and Q318 are not finalized for removal from this measure set as proposed; therefore, they will be retained in this measure set for the 2019 Performance Period and future years. Please note that measures Q468, Q472, Q474, and Q475 were included in the proposed rule for this specialty set; however, they did not have Quality # IDs at the time they were published in the proposed rule because they were new measures. They were included at the beginning of this specialty measure set table in the proposed rule with “TBD” as the Quality # IDs. Therefore, in this final rule, we replaced “TBD” with the assigned Quality # IDs Q468, Q472, Q474, and Q475, which were established for these new measures subsequent to the proposed rule publication and included these measures at the end of this measure set table in ascending order.</p>								

B.6. Internal Medicine

B.14. Physical Medicine

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Physical Medicine specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. CMS may re-assess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This measure set does not have any measures removed from prior years.

We did not receive specific comments regarding the measures included in this specialty measure set.

FINAL ACTION: We are finalizing the *Physical Medicine Specialty Measure Set* as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. In addition, as noted in our responses to public comments in Table C, measures Q154 and Q155 are not finalized for removal from this measure set as proposed; therefore, they will be retained in this measure set for the 2019 Performance Period and future years.

B.15. Preventive Medicine

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Preventive Medicine specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. CMS may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 014.

We did not receive specific comments regarding the measures included in this specialty measure set.

FINAL ACTION: We are finalizing the *Preventive Medicine Specialty Measure Set* as proposed for the 2019 Performance Period and future years. However, as noted in our responses to public comments in Table C, we are not finalizing the following measures for removal from this measure set: Q048, Q154, Q155. Therefore, measures Q048, Q154, Q155 are retained for the 2019 Performance Period and future years. These measures were previously included within the 2018 specialty measure set and therefore they will continue to be included in this measure set. To this end, we have deleted the Removal table in this final rule.

B.16. Neurology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Neurology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. CMS may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This measure set does not have any measures removed from prior years.

<p>Comment: One commenter supported the inclusion of measure Q134: Preventive Care and Screening: Screening for Clinical Depression and Follow-up Plan. Comorbid depression is a frequent concern for patients with neurologic conditions.</p> <p>Response: We thank the commenter for their support of measure Q134: Preventive Care and Screening: Screening for Clinical Depression and Follow-up Plan.</p> <p>Comment: Two commenters do not support removal of Q386: Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences from this measure set. The commenters appreciated the effort to decrease redundancy between this measure and the Q047 Advance Care Plan measure. While these measures do overlap, the commenters noted that ALS measure specification recognizes the likely earlier age of onset of this devastating diagnosis and the need to have earlier planning conversations around palliative and end of life care by having no minimum age requirement. For this reason, the commenter believed the measure should be retained.</p> <p>Response: We agree with the commenters concerns about removing measure Q386 and will not finalize this measure for removal. Specifically, we agree that patients with ALS are often younger than those in the denominator for measure Q047, which includes patients age 65 and older. For this reason, we concur with commenters that a separate measure applying to all patients with a diagnosis of ALS is clinically indicated.</p> <p>Comment: One commenter requested that CMS consider adding the measure Q370: Depression Remission at Twelve Months to this measure set because they stated that comorbid depression is a frequent concern for patients with neurologic conditions.</p> <p>Response: We note that this measure set does include Q134, which screens for depression and would address the commenter's concern of identifying comorbid depression. Prior to rulemaking, we solicit feedback from stakeholders with regards to measures that should be added or removed to existing specialty sets or the development of new specialty sets. The suggestion to add the measure to the Neurology specialty measure set was not provided as part of the feedback received from specialty stakeholders for the 2019 performance period. We ask the commenter to submit their feedback during this solicitation process for future consideration in rulemaking.</p> <p>FINAL ACTION: We are finalizing the <i>Neurology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. In addition, as noted in our responses to public comments in Table C, measures Q154, Q155, and Q386 are not finalized for removal from this measure set as proposed; therefore, they will be retained in this measure set for the 2019 Performance Period and future years.</p>								

B.17. Mental/Behavioral Health

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Mental/Behavioral Health specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. CMS may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measure from the specialty set: Quality ID: 367.

B.17. Mental/Behavioral Health

University of Southern California

Comment: One commenter stated that the Mental/Behavioral Health Specialty Measure Set too narrowly defines the measures' denominator populations. This type of highly detailed specification inappropriately limits the users' abilities to apply otherwise applicable and useful measures to a larger percentage of patients. The commenter also stated that considering the frequency of medical comorbidity diagnoses and the fragmented health care delivery for serious mental illness (SMI) patients, it requested that CMS include more cross-cutting measures that address commonly diagnosed medical comorbidities among patients with SMI into the Mental/Behavioral Health Specialty Measure Set. Due to the nature of the encounter, the eligible clinician-psychiatrist might not utilize otherwise appropriate measures because it might be therapeutically inappropriate. The decision to employ a quality measure for all specialties must be made on a case-by-case basis.

Response: Prior to rulemaking, we solicit feedback from stakeholders with regards to measures that should be added or removed to existing specialty sets or the development of new specialty sets. We ask the commenter to submit their feedback during this solicitation process for future consideration in rulemaking. In addition, eligible clinicians are not limited to selecting measures from their specialty measure set, but have the opportunity to select any of the MIPS measure that are applicable to their practice and workflow. We encourage the commenter to collaborate with measure developers to create robust measures that address patient with serious mental illnesses with comorbidities. Once fully tested, we request the measure be submitted to the Call for Measures process for consideration.

Comment: One commenter stated that behavioral health clinicians (psychiatrists, clinical psychologists), while eligible for MIPS, may not have received the direction and attention that has been focused on other specialties. The commenter requested that CMS provide background on the development of its measures for these behavioral health clinicians and solicit input from these clinicians as to the appropriateness of those measures.

Response: The measures included within the measure specialty set have been reviewed and developed by specialty societies. Prior to rulemaking, we solicit feedback from stakeholders with regards to measures that should be added or removed to existing specialty sets or the development of new specialty sets. We ask the commenter to submit their feedback during this solicitation process for future consideration in rulemaking. Each of the measures included in the specialty measure sets is developed and

B.17. Mental/Behavioral Health

MEASURES FINALIZED FOR INCLUSION								
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward
<p>stewarded by various measure stewards as indicated in the table. The measure steward revises the quality measure during the annual revision cycle based on their technical expert panel input and direction.</p> <p>Comment: One commenter did not agree that new measures must be developed to specifically address patients with mental or substance use disorders and medical comorbidities. Measures that already exist for the general population would be adequate to use to monitor these conditions.</p> <p>Response: We disagree and believe there is a gap in measurement that addresses mental and substance use disorders. Measures applicable to the general population are not appropriate to promote appropriate or adherence of treatment for patient with mental and substance use disorders with comorbidities.</p> <p>Comment: One commenter requested that CMS test the measure Q105: Anti-Depressant Medication Management at the clinician-level before its continued use in MIPS.</p> <p>Response: This measure has been in use at the clinician-level for several years without incident so we believe that its continued use in MIPS is appropriate until clinician-level testing is conducted by the steward. We will continue to encourage the steward to expand testing for this measure at the clinician-level.</p> <p>Comment: One commenter was concerned about the denominator for measure Q107: Adult Major Depressive Disorder (MDD): Suicide Risk Assessment. As currently specified, the denominator limits screening for suicide to patients with new onset or recurrent episodes of Major Depressive Disorder (MDD), instead of applying it to patients with mood disorders, as supported by the measure’s rationale and evidence to measure (part of the National Quality Forum’s 2018 Spring Behavioral Health Measure Endorsement Cycle). Current evidence supports suicide risk assessments for an even broader population, like patients with other mental illnesses who present an increased safety risk. This measure would be better specified by including patients with comorbid-multiple psychiatric illnesses paired with increased substance use and medical conditions (that is, chronic pain). The commenter requested that CMS work with the measure’s developers to also provide a definition of the term “assessment to avoid issues with the measure’s reliability and to provide clarity to those clinicians who do not possess expertise in suicide risk assessments. In addition, the commenter recommended that measure Q107 include references on the use of validated rating scales designed for suicide screening and assessment.</p> <p>Response: This measure was originally developed as part of a suite of measures to improve care for adults with major depressive disorder and was specified and tested for that population. We will give consideration to this suggestion in future updates of the measure. A change in the measure intent as suggested would require additional testing to understand the impact on measure performance, feasibility, reliability, and validity of the measure. A "suicide risk assessment" is defined more explicitly in the Numerator Details section in the human readable format of this measure's technical specifications. The clinical guideline statement also makes reference to key components of a complete assessment. Clinical guidance on how to address and manage patients who screen positive for suicidal ideation is provided in the human readable format of this measure's technical specifications. Use of a standardized tool or instrument to assess suicide risk will meet numerator performance, and can be mapped to a general SNOMED CT code: “Suicide risk assessment (procedure)”. We encourage mapping to this concept in order to ensure that the suicide risk assessment was performed. We will work with the measure steward to consider reference to specific suicide risk assessment tools for clinician guidance in future updates of this measure.</p> <p>Comment: One commenter stated that measure Q105: Anti-Depressant Medication Management consists of a limited denominator. Antidepressants may be prescribed to individuals who do not meet criteria for an MDD diagnosis. According to current evidence, various mental illnesses may be treated with antidepressants; as such, adherence to antidepressants result in more positive health outcomes for those for whom they are appropriately prescribed. Therefore, the commenter requested that CMS engage with the measure’s developers and discuss widening the measure’s population to consist of anyone prescribed antidepressants as guided by current evidence. Thus, this measure should not be considered for use in the MIPS quality performance category until it is tested and demonstrates valid and reliable measurement characteristics.</p> <p>Response: This measure is focused on treating patients with major depression disorder. Expanding the denominator to include all patients taking antidepressants would change the intent of this measure. We will give consideration to this suggestion in future updates of the measure. A change in the measure intent as suggested would require additional testing to understand the impact on measure performance, feasibility, reliability, and validity of the measure.</p> <p>Comment: One commenter appreciated that measure Q325: Adult Major Depressive Disorder (MDD): Coordination of Care of Patients with Specific Comorbid Conditions remains in this measure set. The commenter interpreted the lack of the “Individual Measures List” proposed within the rule to mean that CMS solely supports quality measures as part of specialty measure sets, and the commenter concluded that clinicians would be required to select measures from one of the 33 specialty sets to meet the 6-measure (including one outcome or high priority measure) criteria.</p> <p>Response: We thank the commenter for their support of measure Q325: Adult Major Depressive Disorder (MDD): Coordination of Care of Patients with Specific Comorbid Conditions. Previously finalized measure sets were not republished in the proposed rule and remain available for applicable specialties.</p> <p>FINAL ACTION: We are finalizing the <i>Mental/Behavioral Health Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>								

B.17. Mental/Behavioral Health

MEASURES FINALIZED FOR REMOVAL								
Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.								
NQF #	Quality #	CMS eQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A	367	CMS169 v7	eQM Specifications	Process	Effective Clinical Care	Bipolar Disorder and Major Depression: Appraisal for alcohol or chemical substance use: Percentage of patients with depression or bipolar disorder with evidence of an initial assessment that includes an appraisal for alcohol or chemical substance use.	Center for Quality Assessment and Improvement in Mental Health	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”
<p>Comment: One commenter did not support removal of measure Q367: Bipolar Disorder and Major Depression: Appraisal for alcohol or chemical substance use. The commenter stated that removal would make this measure set lack measures that address unhealthy substance use. The commenter did not agree that measure Q431: Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling is duplicative or superior to measure Q367. If the developers were to update the denominator to include the general population and the numerator to include data capture of the follow-up actions related to the appraisal, this measure would be more useful in MIPS than is measure Q431.</p> <p>Response: Currently, Q367 does not include follow-up actions when there is identified alcohol or substance abuse. The measure steward has not currently specified this for Q367 and although they could add it in the future, it would not be in enough time to implement for the 2019 performance period. Q431 is currently more robust as it includes the requirement of a follow-up action in identified alcohol or substance abuse patients. We agree with the commenter that a measure with a broader denominator to include the general population and the numerator to include data capture of the follow-up actions related to the appraisal would be appropriate. These revisions would require a new measure to be submitted to the Call for Measures process. We encourage the commenter to collaborate with measure developers to create a measure as suggested.</p> <p>FINAL ACTION: We are finalizing the removal of measures from the <i>Mental/Behavioral Health Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>								

B.18. Diagnostic Radiology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Diagnostic Radiology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 359 and 363.

MEASURES FINALIZED FOR INCLUSION									
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	
							• Use of iterative reconstruction technique.		Committee for Quality Assurance
<p>Comment: One commenter noted on measure Q436: Radiation Consideration for Adult CT: Utilization of Dose Lowering Techniques that there is equivalency of a site-based attestation and an attestation included in the individual radiology report. In practice, these generic attestations included in the report are not dictated case-by-case, but rather automatically added to all CT templates in order to satisfy the measure. Adding additional generic comments necessarily lengthens our reports, making it less likely that the requesting clinician will read the entire report or identify the clinically relevant information. The commenter suggested the following: Site-based attestations be sufficient to meet measure Q436, without requiring documentation in each individual adult CT report.</p> <p>Response: This measure does not require detailed comments that would lengthen a report, but requires general attestation statement in the final report; however, there would need to be a written policy in place describing the process that ensures dose optimization techniques are used appropriately per instrument/room, as well as a method for validating that their use occurs for each patient. This may include periodic audits.</p> <p>FINAL ACTION: We are finalizing the <i>Diagnostic Radiology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>									

B.18. Diagnostic Radiology (continued)

MEASURES FINALIZED FOR REMOVAL								
Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.								
NQF #	Quality #	CMS eQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A	359	N/A	MIPS CQMs Specifications	Process	Communication and Care Coordination	Optimizing Patient Exposure to Ionizing Radiation: Utilization of a Standardized Nomenclature for Computed Tomography (CT) Imaging: Percentage of computed tomography (CT) imaging reports for all patients, regardless of age, with the imaging study named according to a standardized nomenclature and the standardized nomenclature is used in institution's computer systems.	American College of Radiology	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in "Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years."
N/A	363	N/A	MIPS CQMs Specifications	Structure	Communication and Care Coordination	Optimizing Patient Exposure to Ionizing Radiation: Search for Prior Computed Tomography (CT) Studies Through a Secure, Authorized, Media-Free, Shared Archive: Percentage of final reports of computed tomography (CT) studies performed for all patients, regardless of age, which document that a search for Digital Imaging and Communications in Medicine (DICOM) format images was conducted for prior patient CT imaging studies completed at non-affiliated external healthcare facilities or entities within the past 12-months and are available through a secure, authorized, media free, shared archive prior to an imaging study being performed.	American College of Radiology	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in "Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years."
<p>Comment: One commenter did not support removal of measure Q359: Optimizing Patient Exposure to Ionizing Radiation: Utilization of a Standardized Nomenclature for Computed Tomography (CT) Imaging. The commenter also did not support the removal of measure Q363: Optimizing Patient Exposure to Ionizing Radiation: Search for Prior Computed Tomography (CT) Studies Through a Secure, Authorized, Media-Free, Shared Archive. The commenter indicated that the number of radiology measures is limited, and that additional measures should be added before additional measures are removed, and CMS should also encourage clinicians to take greater advantage of existing studies as a means of reducing unnecessary duplicative exams.</p> <p>Response: We encourage measure developers to submit additional radiology measures through the Call for Measures process. In the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process.</p> <p>FINAL ACTION: We are finalizing the removal of measures from the <i>Diagnostic Radiology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>								

B.19. Nephrology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Nephrology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 122 and 327.

B.19. Nephrology

MEASURES FINALIZED FOR INCLUSION								
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward
§ ! (Outcome)	0059	001	CMS122 v7	Medicare Part B Claims Measure Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications, eCQM Specifications.	Intermediate Outcome	Effective Clinical Care	Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%): Percentage of patients 18-75 years of age with diabetes who had hemoglobin A1c > 9.0 percent during the measurement period.	National Committee for Quality Assurance
§ ! (Care Coordination) *	0097	046	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Communication and Care Coordination	Medication Reconciliation Post-Discharge: The percentage of discharges from any inpatient facility (for example hospital, skilled nursing facility, or rehabilitation facility) for patients 18 years of age and older seen within 30 days following discharge in the office by the physician, prescribing practitioner, registered nurse, or clinical pharmacist providing on-going care for whom the discharge medication list was reconciled with the current medication list in the outpatient medical record. This measure is submitted as three rates stratified by age group: • Submission Criteria 1: 18-64 years of age. • Submission Criteria 2: 65 years and older. • Total Rate: All patients 18 years of age and older.	National Committee for Quality Assurance
! We did not receive specific comments regarding the measures included in this specialty measure set.									
FINAL ACTION: We are finalizing the <i>Nephrology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. In addition, as noted in our responses to public comments in Table C, measure Q386 is not finalized for removal from this measure set as proposed; therefore, it will be retained in this measure set for the 2019 Performance Period and future years.									

B.19. Nephrology (continued)

MEASURES FINALIZED FOR REMOVAL

Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A	122	N/A	MIPS CQMs Specifications	Intermediate Outcome	Effective Clinical Care	Adult Kidney Disease: Blood Pressure Management: Percentage of patient visits for those patients aged 18 years and older with a diagnosis of chronic kidney disease (CKD) (stage 3, 4, or 5, not receiving Renal Replacement Therapy [RRT]) with a blood pressure < 140/90 mmHg OR ≥ 140/90 mmHg with a documented plan of care.	Renal Physicians Association	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”
N/A	327	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Pediatric Kidney Disease: Adequacy of Volume Management: Percentage of calendar months within a 12-month period during which patients aged 17 years and younger with a diagnosis of End Stage Renal Disease (ESRD) undergoing maintenance hemodialysis in an outpatient dialysis facility have an assessment of the adequacy of volume management from a nephrologist.	Renal Physicians Association	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”

We did not receive specific comments regarding the proposed removal of measures from this specialty measure set.

FINAL ACTION: We are finalizing the removal of measures from the *Nephrology Specialty Measure Set* as proposed for the 2019 Performance Period and future years. However, as noted in our responses to public comments in Table C, we are not finalizing the following measure proposed for removal from this measure set: Q318.

B.20. General Surgery

In addition to the considerations discussed in the introductory language of Table B in this final rule, the General Surgery specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This measure set does not have any measures removed from prior years.

B.20. General Surgery

National Committee for Quality Assurance

Comment: One commenter noted the inclusion of measure Q264: Sentinel Lymph Node Biopsy for Invasive Breast Cancer measure as a new measure in this measure set in the 2019 performance year. They support the inclusion of this measure in this measure set.

Response: We thank the commenter for their support.

FINAL ACTION: We are finalizing the *General Surgery Specialty Measure Set* as proposed for the 2019 Performance Period and future years. Note: Measure Q263 was incorrectly attributed to this measure set and proposed as a removal from this measure set in the proposed rule; therefore, the removal table that included measure 263 has been deleted from this final rule.

B.21. Vascular Surgery

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Vascular Surgery specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 257 and 423.

The measure contains four goals. All four goals within a measure must be reached in order to meet that measure. The numerator for the all-or-none measure should be collected from the organization's total IVD denominator. All-or-None Outcome Measure (Optimal Control) - Using the IVD denominator optimal results include: <ul style="list-style-type: none">• Most recent blood pressure (BP) measurement is less than or equal to 140/90 mm Hg; and• Most recent tobacco status is Tobacco Free; and• Daily Aspirin or Other Antiplatelet Unless Contraindicated; and• Statin Use Unless Contraindicated.	Wisconsin Collaborative for Healthcare Quality (WCHQ)
We did not receive specific comments regarding the measures included in this specialty measure set.									
FINAL ACTION: We are finalizing the <i>Vascular Surgery Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.									

B.21. Vascular Surgery (continued)

MEASURES FINALIZED FOR REMOVAL

Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
1519	257	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Statin Therapy at Discharge after Lower Extremity Bypass (LEB): Percentage of patients aged 18 years and older undergoing infra-inguinal lower extremity bypass who are prescribed a statin medication at discharge.	Society for Vascular Surgeons	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”
0465	423	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Effective Clinical Care	Perioperative Anti-platelet Therapy for Patients Undergoing Carotid Endarterectomy: Percentage of patients undergoing carotid endarterectomy (CEA) who are taking an anti-platelet agent within 48 hours prior to surgery and are prescribed this medication at hospital discharge following surgery.	Society for Vascular Surgeons	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”

Comment: One commenter stated that measure Q257: Statin Therapy at Discharge after Lower Extremity Bypass (LEB) is not duplicative of the new measure for Ischemic Vascular Disease – Use of Aspirin or Anti-platelet Medication proposed for 2019. An important part of this measure is its timeframe. In many institutions, anti-platelet agents are stopped 7 days prior to any procedure/operation. Ensuring that the patient stays on the antiplatelet agent in the pre-operative period often requires extra effort and coordination so the commenter believed measure Q257 should be maintained for 2019. The benefit of statins has been well-documented.

Response: We agree with the commenter that it is not duplicative of a proposed measure Ischemic Vascular Disease – Use of Aspirin or Anti-platelet Medication. We cited that this measure was duplicative of measure Q438: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease.

FINAL ACTION: We are finalizing the removal of measures from the *Vascular Surgery Specialty Measure Set* as proposed for the 2019 Performance Period and future years.

B.22. Thoracic Surgery

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Thoracic Surgery specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measures from the specialty set: Quality IDs: 043, 236, and 441.

B.22. Thoracic Surgery

							Health	The percentage of adolescents 12 to 20 years of age with a primary care visit during the measurement year for whom tobacco use status was documented and received help with quitting if identified as a tobacco user.	Quality Assurance
	§ !	0119	445	N/A	MIPS CQMs Specifications	Outcome	Effective Clinical Care	Risk-Adjusted Operative Mortality for Coronary Artery Bypass Graft (CABG): Percent of patients aged 18 years and older undergoing isolated CABG who die, including both all deaths occurring during the hospitalization in which the CABG was performed, even if after 30 days, and those deaths occurring after discharge from the hospital, but within 30 days of the procedure.	Society of Thoracic Surgeons
<p>Comment: One commenter noted that the correct measure steward for the following measures should be the "Society of Thoracic Surgeons": Q164: CABG: Prolonged Intubation; Q165: CABG: Deep Sternal Wound Infection Rate; Q166: CABG: Stroke; Q167: CABG: PostOp Renal Failure</p> <p>Response: We have updated the measure steward for these measures accordingly.</p> <p>Comment: The commenter stated that measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented is not appropriate for the Thoracic Surgery Specialty Set and requested its removal for CY 2019. The commenter noted that blood pressure management is outside of the scope of practice of cardiothoracic surgeons.</p> <p>Response: We do not agree to remove the measure from the Thoracic Surgery specialty set because if the patient has an elevated blood pressure at post-op, it is within the thoracic surgeon's scope to recommend a follow-up with the patient's PCP. In addition, we believe that if the thoracic surgeon should assess a patient at pre-operatively or post-operatively, there should be blood pressure screening.</p> <p>Comment: One commenter supported inclusion of measures Q358: Patient-Centered Surgical Risk Assessment and Communication.</p> <p>Response: We thank the commenter for their support of measure Q358: Patient-Centered Surgical Risk Assessment and Communication.</p> <p>FINAL ACTION: We are finalizing the <i>Thoracic Surgery Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>									

B.22. Thoracic Surgery (continued)

MEASURES FINALIZED FOR REMOVAL								
Note: In this final rule, CMS removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.								
NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
0134	043	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Coronary Artery Bypass Graft (CABG): Use of Internal Mammary Artery (IMA) in Patients with Isolated CABG Surgery: Percentage of patients aged 18 years and older undergoing isolated CABG surgery who received an IMA graft.	Society of Thoracic Surgeons	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”
0018	236	CMS165 v7	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications	Intermediate Outcome	Effective Clinical Care	Controlling High Blood Pressure: Percentage of patients 18-85 years of age who had a diagnosis of hypertension and whose blood pressure was adequately controlled (<140/90mmHg) during the measurement period.	National Committee for Quality Assurance	We agree with specialty society feedback to remove this measure from this specialty set because blood pressure control is managed by care team members other than the cardiothoracic surgeon. Blood pressure outcomes are more likely attributed to the primary care provider or cardiologist. These eligible clinicians are part of the core treatment team that is responsible for the ongoing hypertension therapy.
N/A	441	N/A	MIPS CQMs Specifications	Intermediate Outcome	Effective Clinical Care	Ischemic Vascular Disease All or None Outcome Measure (Optimal Control): The IVD All-or-None Measure is one outcome measure (optimal control). The measure contains four goals. All four goals within a measure must be reached in order to meet that measure. The numerator for the all-or-none measure should be collected from the organization's total IVD denominator. All-or-None Outcome Measure (Optimal Control) - Using the IVD denominator optimal results include: <ul style="list-style-type: none"> • Most recent blood pressure (BP) measurement is less than or equal to 140/90 mm Hg; and • Most recent tobacco status is Tobacco Free; and • Daily Aspirin or Other Antiplatelet Unless Contraindicated; and • Statin Use Unless Contraindicated. 	Wisconsin Collaborative for Healthcare Quality (WCHQ)	We agree with specialty society feedback to remove this measure from this specialty set because the outcomes and medications within the measure are managed by care team members other than the cardiothoracic surgeon. Blood pressure and tobacco cessation outcomes are more likely attributed to the primary care provider or cardiologist. These eligible clinicians are part of the core treatment team that is responsible for the ongoing ischemic vascular disease care.
<p>Comment: One commenter opposed removal of measure Q043: CABG: Use of Internal Mammary Artery (IMA) in Patients with Isolated CABG Surgery due to topped out status. The commenter stated that IMA use is so important to long-term graft patency and if CMS removes this life-saving measure from MIPS, there will be little incentive for clinicians to report it and thus, a natural tendency for performance to slip without anyone’s knowledge. The commenter opposed the proposal to modify the existing topped-out measure policy to allow for the immediate removal of highly topped out measures.</p> <p>Response: This measure leaves little room for improvement as reflected in the 2018 MIPS Benchmark Results as an average performance rate of 99 percent which supports the removal as it is a standard of care. The measure has limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying and restricts the creation of meaningful benchmarks. This provides little incentive for clinicians to report the measure since the performance data does not allow for maximum points to be awarded. We advise the commenter to collaborate with measure developers to submit more robust or outcome measures through</p>								

the Call for Measures process.

Comment: One commenter did not see that measure Q441: Ischemic Vascular Disease All or None Outcome Measure (Optimal Control) was in the removal table for Thoracic Surgery in the proposed rule, but supported its removal since not all of the four goals reflected in the measure are appropriate for acute surgical patients.

Response: We thank the commenter for feedback regarding the removal of this measure. We agree with the commenter's assessment that not all of the goals are applicable for this specialty. The measure was inadvertently not included in this specialty measure set tables but it was our intent to remove this measure from this specialty measure set based on similar feedback received prior to the public comment period.

Comment: Several commenters supported the removal of measure Q236: Controlling High Blood Pressure. Blood pressure control is managed by care team members other than the cardiothoracic surgeon.

Response: We thank the commenters for supporting the removal of measure Q236: Controlling High Blood Pressure.

FINAL ACTION: We are finalizing the removal of measures from the *Thoracic Surgery Specialty Measure Set* as proposed for the 2019 Performance Period and future years. Note: We are also including the removal of Q441 based on public comments above supporting removal.

B.23. Urology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Urology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set.

We did not receive specific comments regarding the measures included in this specialty measure set.								
FINAL ACTION: We are finalizing the <i>Oncology Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.								

B.24b. Radiation Oncology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Radiation Oncology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. In addition, as outlined at the end of this table, we removed the following quality measure from the specialty set: Quality ID: 156.

B.24b. Radiation Oncology

Note: In this final rule, we removed the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

Measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.									
NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description		Measure Steward	Rationale for Removal
						Cirrhosis: Percentage of patients aged 18 years and older with a diagnosis of chronic hepatitis C cirrhosis who underwent imaging with either ultrasound, contrast enhanced CT or MRI for hepatocellular carcinoma (HCC) at least once within the 12-month submission period.			applicable nor a clinically relevant quality measure to assess the clinical performance of an Infectious Disease physician. This measure applies to the outpatient setting and is reported by primary care, gastroenterologists, or other physicians to ensure appropriate screening for patients with cirrhosis. Most infectious disease physicians consult on patients in the inpatient setting. This measure does not support the inpatient setting where the majority of eligible clinicians within this specialty practice.
	N/A	447	N/A	MIPS CQMs Specifications	Process	Community / Population Health	Chlamydia Screening and Follow Up: The percentage of female adolescents 16 years of age who had a chlamydia screening test with proper follow-up during the measurement period.	National Committee for Quality Assurance	This measure is being removed from the 2019 program based on the detailed rationale described below for this measure in “Table C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years.”

Comment: One commenter supported removing measure Q065: Appropriate Treatment for Children with Upper Respiratory Infection, Appropriate Testing for Children with Pharyngitis and Avoidance of Antibiotic Treatment in Adults with Acute Bronchitis from the Infectious Disease set. That set focuses on acute care while these measures focus on primary care.

Response: We thank the commenter for their support on removal of this measure.

Comment: One commenter noted that there will be a negative impact from the removal of measures Q130 and Q226 on quality reporting for Infectious Disease specialists and across all eligible medical specialties. They noted that according to the 2016 PQRS Experience Report the 41 MD/DO specialties listed in Table 14: Top Reported Individual Measures by Specialty or Provider Type (2016) in the 2016 PQRS Experience Report, Q130 was the top measure reported by 29 specialties (70 percent) and Q226 was reported the second most by 21 specialties (51 percent). In addition, across all medical specialties claims-based reporting was the most utilized method of reporting for the 2016 PQRS program. With the above rationale, the commenter asked CMS to consider retaining measure Q130 and Q226 as they would not only affect the opportunities to report for Infectious Disease physicians but most of medical specialties.

Response: To clarify, measure Q130 was not proposed for removal from the Infectious Disease specialty measure set nor from the 2019 Quality Payment Program as a whole, and therefore, will be retained for reporting. Also to clarify further, Q226 was not proposed for removal from the program in general but only proposed to be removed from the Infectious Disease specialty measure set. While we agree that Q226 is a highly reported measure that is applicable to many eligible clinicians, we received specific feedback from specialty societies that this measure was not applicable to most infectious disease physicians as they mostly consult in an inpatient setting. Q226 is specific to the outpatient setting and therefore would not be applicable to most infectious disease physicians.

FINAL ACTION: We are finalizing the removal of measures from the *Infectious Disease Specialty Measure Set* as proposed for the 2019 Performance Period and future years.

B.26. Neurosurgical

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Neurosurgical specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This measure set does not have any measures removed from prior years.

B.26. Neurosurgical

B.26. Neurosurgical

MEASURES FINALIZED FOR INCLUSION								
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward
<p>Comment: One commenter requested for measure Q023: Perioperative Care: Venous Thromboembolism (VTE) Prophylaxis (When Indicated in ALL Patients) that the measure be changed to exclude unicompartmental/partial knee replacement in the denominator until the developer can consider the inclusion of ASA for acceptable prophylaxis consistent with current guidelines.</p> <p>Response: We agree that the measure should align with current clinical guidelines. We will provide this suggestion to the measure steward for future consideration in the annual updates of the measure specifications.</p>								
<p>Comment: One commenter supported measure Q187: Stroke and Stroke Rehabilitation: Thrombolytic Therapy in this measure set. The commenter encouraged CMS to continue to consider measurement and payment of high quality, cost effective stroke care in all settings, including in the hospital inpatient setting.</p> <p>Response: We thank the commenter for their support of measure Q187: Stroke and Stroke Rehabilitation: Thrombolytic Therapy.</p>								
<p>Comment: Once commenter expressed concern about the following new measures in this measure set: Q469: Average Change in Functional Status Following Lumbar Spine Fusion Surgery; Q471: Average Change in Functional Status Following Lumbar Discectomy Laminotomy Surgery; and Q473: Average Change in Leg Pain Following Lumbar Spine Fusion Surgery. Although the commenter supported the measures in concept, they noted that the measures require the use of specific tools to capture pain (that is, Visual Analog Scale or VAS) and functional status (that is, Oswestry Disability Index or ODI) despite the existence of equally useful scoring systems. The commenter also noted these measures should provide more flexibility to clinicians by instead focusing more generically on “improvement on a validated pain or disability patient-reported outcome tool.” The commenter further expressed concern that they were never consulted about the appropriateness of these measures and would have appreciated an earlier opportunity to provide feedback.</p> <p>Response: The measure steward has developed and tested these measures using the VAS and ODI tools to assess the change in status. We do not own this measure and encourage the commenter to collaborate with the measure steward to expand the assessment tools. With regard to concerns about measure selection input for this specialty set, prior to rulemaking we solicit feedback from stakeholders with regards to measures that should be added or removed to existing specialty sets or the development of new specialty sets. We ask the commenter to submit their feedback during this solicitation process for future consideration in rulemaking.</p>								
<p>FINAL ACTION: We are finalizing the <i>Neurosurgical Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years.</p>								

B.27. Podiatry

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Podiatry specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This measure set does not have any measures removed from prior years.

We did not receive specific comments regarding the measures included in this specialty measure set.								
<p>FINAL ACTION: We are finalizing the <i>Podiatry Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. In addition, as noted in our responses to public comments in Table C, measures Q154, Q155, and Q318 are not finalized for removal from this measure set as proposed; therefore, they will be retained in this measure set for the 2019 Performance Period and future years.</p>								

B.28. Rheumatology

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Rheumatology specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This measure set does not have any measures removed from prior years.

! (Outcome) *	0428	223	N/A	MIPS CQMs Specifications	Patient Reported Outcome	Communication and Care Coordination	Functional Status Change for Patients with General Orthopedic Impairments: A patient-reported outcome measure of risk-adjusted change in functional status (FS) for patients aged 14 years+ with general orthopedic impairments (neck, cranium, mandible, thoracic spine, ribs or other general orthopedic impairment). The change in FS is assessed using the General Orthopedic FS PROM (patient reported outcome measure) (©Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey).		Focus on Therapeutic Outcomes, Inc.

Comment: One commenter supported the creation of the Physical and Occupational Therapy Specialty Measure Set. The commenter encouraged CMS to make two additional measures available to physical therapists (Q126 Diabetic Foot and Ankle Care, Peripheral Neuropathy: Neurological Evaluation; and Q127 Diabetic Foot and Ankle Care, Ulcer Prevention Evaluation of Footwear) and three additional measures available to occupational therapists (Q134 Screening for Depression and Follow-Up Plan); Q181 Elder Maltreatment Screen and Follow-Up Plan); and Q226 Tobacco Use: Screening and Cessation Intervention).

Response: We will provide this recommendation to the measure steward for measures Q126 Diabetic Foot and Ankle Care, Peripheral Neuropathy: Neurological Evaluation, Q127 Diabetic Foot and Ankle Care, Ulcer Prevention Evaluation of Footwear, and Q226 Tobacco Use: Screening and Cessation Intervention. We will evaluate the commenter's request for inclusion for future revisions for measures Q134 Screening for Depression and Follow-Up Plan, Q181 Elder Maltreatment Screen and Follow-Up Plan. We maintain that the measures are still valid as currently specified which includes many clinical settings, but will thoroughly vet the request to include physical and occupational therapy.

FINAL ACTION: We are finalizing the *Physical Therapy/Occupational Therapy Specialty Measure Set* as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. .

B.30. Geriatrics

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Geriatrics specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This is a new specialty set for 2019; therefore, we are not removing any measures from this specialty set.

B.30. Geriatrics

MEASURES FINALIZED FOR INCLUSION									
Indicator	NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward

! (Opioid)	N/A	414	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Evaluation or Interview for Risk of Opioid Misuse: All patients 18 and older prescribed opiates for longer than 6 weeks duration evaluated for risk of opioid misuse using a brief validated instrument (for example Opioid Risk Tool, SOAPP-R) or patient interview documented at least once during Opioid Therapy in the medical record.	American Academy of Neurology
§ ! (Outcome)	0213	455	N/A	MIPS CQMs Specifications	Outcome	Effective Clinical Care	Percentage of Patients Who Died from Cancer Admitted to the Intensive Care Unit (ICU) in the Last 30 Days of Life (lower score – better): Percentage of patients who died from cancer admitted to the ICU in the last 30 days of life.	American Society of Clinical Oncology
	N/A	474	N/A	MIPS CQMs Specifications	Process	Community/Population Health	Zoster (Shingles) Vaccination: The percentage of patients 50 years of age and older who have a Varicella Zoster (shingles) vaccination.	PPRNet
Comment: One commenter recommended that this measure set be finalized. The commenter appreciated CMS’ support of measures for the geriatrics population that CMS expends the most resources. The commenter noted that measure: Q474: Zoster (Shingles) Vaccination is not presently covered under Medicare Part B. The only Part B covered vaccines are influenza, hepatitis, and pneumococcal pneumonia. Because the Zoster (Shingles) vaccine is covered under Part D patients may incur cost-sharing obligations.								
Response: This measure is being implemented as a MIPS CQM measure specification which allows all payer data. We appreciate the concern but believe this is a valuable measure that will promote the vaccination and open dialogue between the patient eligible clinician regarding the benefits of this vaccine.								
FINAL ACTION: We are finalizing the <i>Geriatrics Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population.								

B.31. Urgent Care

In addition to the considerations discussed in the introductory language of Table B in this final rule, the Urgent Care specialty set takes into consideration the following criteria, which includes, but is not limited to: the measure reflects current clinical guidelines and the coding of the measure includes the specialists. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. This is a new specialty set for 2019; therefore, we are not removing any measures from this specialty set.

<p>Comment: One commenter was pleased to see the new proposed Skilled Nursing Facility Specialty Measure Set. The commenter noted this is the first step to delineating the SNF/NF setting as an integral but different area of practice of medicine that deserves its own consideration within MIPS and APM programs. However, the commenter noted that while there are many “reportable” measures included in the MIPS program, some measures are counter to recommendations for the SNF/NF population. The commenter requested CMS consider the following measures for this measure set; Q006: Coronary Artery Disease (CAD); Antiplatelet Therapy; Q007: Coronary Artery Disease (CAD); Beta-Blocker Therapy- Prior Myocardial Infraction (MI) or Left Ventricular Systolic Dysfunction (LVEF < 40 percent); Q047: Advance Care Plans; Q110: Preventive Care and Screening: Influenza Immunization; Q118: Coronary Artery Disease (CAD); Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy - Diabetes or Left Ventricular Systolic Dysfunction (LVEF < 40 percent); Q154: Falls: Risk Assessment (Two part measure pair with Q155); Q155: Falls: Plan of Care (Two part measure- pair with Q154); Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-up Documented; and Q326: Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy. Other commenters were supportive of the addition of the Skilled Nursing Facility measure set.</p> <p>Response: We agree that this specialty set will assist clinicians who provide care within SNFs to identify measures applicable to their patient population. All of the measures suggested by the commenter (except Q154 and Q155) were proposed for inclusion in this specialty measure set and we agree that they are applicable to Skilled Nursing Facilities. In addition, we agree with the commenter that measures Q154 and Q155 should be included in this measure set for the 2019 Performance Period and future years.</p> <p>FINAL ACTION: We are finalizing the <i>Skilled Nursing Facility Specialty Measure Set</i> as proposed for the 2019 Performance Period and future years with the exception of the newly proposed composite measure: Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls. We are no longer finalizing the inclusion of the composite falls measure because it must be fully vetted to utilize standardized tools that would appropriately identify the at-risk patient population. However, based on public comments, we are finalizing the individual measures Q154: Falls: Risk Assessment and Q155: Falls: Plan of Care as additional measures in this measure set.</p>									

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

In this final rule, we removed 26 previously finalized quality measures from the MIPS Program for the 2021 MIPS payment year and future years. These measures are discussed in detail below. As discussed in section III.I.3.h.(2)(b) of the final rule, please note that our measure removal criteria considers the following:

- Whether the removal of the measure impacts the number of measures available to a specific specialty
- Whether the measure addresses a priority area of the Meaningful Measures Initiative
- Whether the measure is linked closely to improved outcomes in patients

Further considerations are given in the evaluation of the measure's performance data, to determine whether there is or no longer is variation in performance. As discussed in section III.I.3.h.(2)(b) of this final rule, we applied additional criteria this year for the removal of measures, such as: extreme topped out measures, which means measures that are topped-out with an average (mean) performance rate between 98-100 percent.

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
	0088	018	CMS167v7	eCQM Specifications	Process	Effective Clinical Care Diabetic Retinopathy: Documentation of Presence or Absence of Macular Edema and Level of Severity of Retinopathy: Percentage of patients aged 18 years and older with a diagnosis of diabetic retinopathy who had a dilated macular or fundus exam performed which included documentation of the level of severity of retinopathy and the presence or absence of macular edema during one or more office visits within 12 months.	Physician Consortium for Performance Improvement Foundation (PCPI®)	We proposed removal of this measure (finalized in (81 FR 77558 through 77675)) because it is duplicative both in concept and patient population as the currently adopted Measure 019: Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care (finalized in (81 FR 77558 through 77675)). Measure 019 is considered high priority because it promotes communication and care coordination with eligible clinicians managing diabetes care. The numerator of Measure 018 is considered the standard of care as it captures an assessment with no additional clinical action. Measure 018 neither assesses a clinical outcome nor one of the defined MIPS high priority areas.
	0134	043	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care Coronary Artery Bypass Graft (CABG): Use of Internal Mammary Artery (IMA) in Patients with Isolated CABG Surgery: Percentage of patients aged 18 years and older undergoing isolated CABG surgery who received an IMA graft.	Society of Thoracic Surgeons	We proposed removal of this measure (finalized in (81 FR 77558 through 77675)) because there is no longer variation in performance for the measure to be able to evaluate improvement in performance making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 99 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip . Therefore, we believe use of IMA has been widely accepted and implemented. The measure neither assesses a clinical outcome nor one of the defined MIPS high priority areas.
	N/A	099	N/A	Medicare Part B Claims Measure Specifications,	Process	Effective Clinical Care Breast Cancer Resection Pathology Reporting: pT Category (Primary Tumor) and pN Category	College of American Pathologists	We proposed removal of this measure (finalized in (81 FR 77558 through 77675)) because it is considered a standard of care that h

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
				MIPS CQMs Specifications				a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 99 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip . In addition, the measure does not assess a clinical outcome nor one of the defined MIPS high priority areas.
N/A0392	100	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Effective Clinical Care	Colorectal Cancer Resection Pathology Reporting: pT Category (Primary Tumor) and pN Category (Regional Lymph Nodes) with Histologic Grade: Percentage of colon and rectum cancer resection pathology reports that include the pT category (primary tumor), the pN category (regional lymph nodes) and the histologic grade	College of American Pathologists	We proposed removal of this measure (finalized in (81 FR 77558 through 77675)) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 99.5 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip . In addition, the measure neither assesses a clinical outcome nor one of the defined MIPS high priority areas.
N/A	122	N/A	MIPS CQMs Specifications	Intermediate Outcome	Effective Clinical Care	Adult Kidney Disease: Blood Pressure Management: Percentage of patient visits for those patients aged 18 years and older with a diagnosis of chronic kidney disease (CKD) (stage 3, 4, or 5, not receiving Renal Replacement Therapy [RRT]) with a blood pressure < 140/90 mmHg OR ≥ 140/90 mmHg with a documented plan of care.	Renal Physicians Association	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because the measure has neither been updated nor planned to be updated by the measure steward to reflect the current clinical guidelines as indicated by the measure steward.
0566	140	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Effective Clinical Care	Age-Related Macular Degeneration (AMD): Counseling on Antioxidant Supplement: Percentage of patients aged 50 years and older with a diagnosis of age-related macular degeneration (AMD) or their caregiver(s) who were	American Academy of Ophthalmology	We proposed removal of this measure (finalized in (81 FR 77558 through 77675)) because the measure neither assesses a clinical outcome nor one of the defined MIPS high priority areas. The measure's quality action that only requires the provision of counseling of AREDS risk factors, but does not require discontinuation of

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal	
						counseled within the 12-month performance period on the benefits and/or risks of the Age-Related Eye Disease Study (AREDS) 2 formulation for preventing progression of AMD.		AREDS if risks/adverse effects are identified.	
	N/A	156	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Patient Safety	Oncology: Radiation Dose Limits to Normal Tissues: Percentage of patients, regardless of age, with a diagnosis of breast, rectal, pancreatic or lung cancer receiving 3D conformal radiation therapy who had documentation in medical record that radiation dose limits to normal tissues were established prior to the initiation of a course of 3D conformal radiation for a minimum of two tissues.	American Society for Radiation Oncology	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 97.5 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip .
	0056	163	CMS123v7	eCQM Specifications	Process	Effective Clinical Care	Comprehensive Diabetes Care: Foot Exam: The percentage of patients 18-75 years of age with diabetes (type 1 and type 2) who received a foot exam (visual inspection and sensory exam with mono filament and a pulse exam) during the measurement year.	National Committee for Quality Assurance	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is duplicative to the currently adopted Measure 126: Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy – Neurological Evaluation (finalized in 81 FR 77558 through 77675). However, Measure 163 is designated as a core performance measure by the Core Quality Measures Collaborative (https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/CoreCQMs.html). Therefore, we specifically seek comments regarding the impact of removing this measure and replacing it with Measure 126. We strive to not duplicate measures in the program. We believe Measure 126 is a more appropriate measure because it targets an at-risk patient population, is clinically significant, and is in alignment with current clinical guidelines for neurological evaluation of diabetic neuropathy.
	0068	204	CMS164v7	Medicare Part B Claims Measure Specifications, eCQM Specifications,	Process	Effective Clinical Care	Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet: Percentage of patients 18 years of age and older who were diagnosed with acute	National Committee for Quality Assurance	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it would be duplicative of a component within the existing measure Q441: Ischemic Vascular Disease: All or

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
				CMS Web Interface Measure Specifications, MIPS CQMs Specifications		myocardial infarction (AMI), coronary artery bypass graft (CABG) or percutaneous coronary interventions (PCI) in the 12 months prior to the measurement period, or who had an active diagnosis of ischemic vascular disease (IVD) during the measurement period, and who had documentation of use of aspirin or another antiplatelet during the measurement period.		None Outcome Measure We strive to not duplicate measures in the program. In this case, we concluded that measure Q204 is captured within the more robust composite measure Q441.
	N/A	224	N/A	MIPS CQMs Specifications	Process	Efficiency and Cost Reduction Melanoma: Avoidance of Overutilization of Imaging Studies: Percentage of patients, regardless of age, with a current diagnosis of stage 0 through IIC melanoma or a history of melanoma of any stage, without signs or symptoms suggesting systemic spread, seen for an office visit during the one-year measurement period, for whom no diagnostic imaging studies were ordered.	American Academy of Dermatology	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 99.5 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip .
	N/A	251	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Structure	Effective Clinical Care Quantitative Immunohistochemical (IHC) Evaluation of Human Epidermal Growth Factor Receptor 2 Testing (HER2) for Breast Cancer Patients: This is a measure based on whether quantitative evaluation of Human Epidermal Growth Factor Receptor 2 Testing (HER2) by immunohistochemistry (IHC) uses the system recommended in the current ASCO/CAP Guidelines for Human Epidermal Growth Factor Receptor 2 Testing in breast cancer	College of American Pathologists	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 99 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip . In addition, the measure does not assess a clinical outcome or one of the defined MIPS high priority areas.
1519	257	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Statin Therapy at Discharge after Lower Extremity Bypass (LEB): Percentage of patients aged 18 years and older undergoing infra-inguinal lower extremity bypass who are prescribed a statin	Society for Vascular Surgeons	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because the clinical concept is captured within currently adopted Measure 438: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease (finalized in 81 FR 77558

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
						medication at discharge.		through 77675). Measure 438 captures all patients that require statin therapy. Whereas Measure 257 only captures a subset of the patient population undergoing lower extremity bypass.
	N/A	276	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	American Academy of Sleep Medicine	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is duplicative to the currently adopted Measure 277: Sleep Apnea: Severity Assessment at Initial Diagnosis (finalized in 81 FR 77558 through 77675). Measure 276 only represents a quality action to assess for the sleep symptoms whereas Measure 277 includes the assessment along with the severity. This measure also lacks a quality action for positive assessments and does not indicate the use of a standardized tool. Also, the measure does not assess a clinical outcome nor one of the defined MIPS high priority areas.
	N/A	278	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	American Academy of Sleep Medicine	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is duplicative to currently adopted Measure 279: Sleep Apnea: Assessment of Adherence to Positive Airway Pressure Therapy (finalized in 81 FR 77558 through 77675). Measure 279 is more robust and requires assessment of adherence to the therapy. Measure 278 does not assess a clinical outcome nor one of the defined MIPS high priority areas.
	N/A	263	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	American Society of Breast Surgeons	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying. The average performance for this measure is 99.3 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip . In addition, the measure does not assess a clinical outcome nor one of the defined MIPS high priority areas.
	N/A	327	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Renal Physicians Association	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal	
						period during which patients aged 17 years and younger with a diagnosis of End Stage Renal Disease (ESRD) undergoing maintenance hemodialysis in an outpatient dialysis facility have an assessment of the adequacy of volume management from a nephrologist.		improve clinical outcomes as it does not require a quality action if adequate volume management is not achieved. . In addition, the measure does not assess a clinical outcome nor one of the defined MIPS high priority areas.	
	N/A	334	N/A	MIPS CQMs Specifications	Efficiency	Efficiency and Cost Reduction	Adult Sinusitis: More than One Computerized Tomography (CT) Scan Within 90 Days for Chronic Sinusitis (Overuse): Percentage of patients aged 18 years and older with a diagnosis of chronic sinusitis who had more than one CT scan of the paranasal sinuses ordered or received within 90 days after the date of diagnosis.	American Academy of Otolaryngology-Head and Neck Surgery	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 1.6 percent (inverse measure where a lower score is better performance) based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip .
	N/A	359	N/A	MIPS CQMs Specifications	Process	Communication and Care Coordination	Optimizing Patient Exposure to Ionizing Radiation: Utilization of a Standardized Nomenclature for Computed Tomography (CT) Imaging: Percentage of computed tomography (CT) imaging reports for all patients, regardless of age, with the imaging study named according to a standardized nomenclature and the standardized nomenclature is used in institution’s computer systems.	American College of Radiology	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is duplicative of the currently adopted Measure 361: Optimizing Patient Exposure to Ionizing Radiation: Reporting to a Radiation Dose Index Registry (finalized in 81 FR 77558 through 77675). The use of standardized nomenclature within this measure is intended to enable reporting to Dose Index Registries to allow comparison across radiology sites. This measure does not require the submission to a Dose Index Registry as indicated in Measure 361, but merely using standard nomenclature. We will continue to maintain Measure 361 that represents a more robust quality action to submit standardized data elements to a Dose Index Registry.
	N/A	363	N/A	MIPS CQMs Specifications	Structure	Communication and Care Coordination	Optimizing Patient Exposure to Ionizing Radiation: Search for Prior Computed Tomography (CT) Studies Through a Secure, Authorized, Media-Free, Shared Archive:	American College of Radiology	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because the quality action does not completely attribute to the radiologist submitting the measure. Often, the CT studies are ordered and completed by referring clinicians without opportunity to

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description		Measure Steward	Rationale for Removal	
							Percentage of final reports of computed tomography (CT) studies performed for all patients, regardless of age, which document that a search for Digital Imaging and Communications in Medicine (DICOM) format images was conducted for prior patient CT imaging studies completed at non-affiliated external healthcare facilities or entities within the past 12-months and are available through a secure, authorized, media free, shared archive prior to an imaging study being performed.		complete the quality action by the radiologist. This allows their quality performance score to be impacted by other eligible clinicians. In addition, the measure does not require a quality action that links to improved outcomes when the search is completed prior to the study (that is, comparison).	
	N/A	367	CMS169v7	eCQM Specifications	Process	Effective Clinical Care	Bipolar Disorder and Major Depression: Appraisal for alcohol or chemical substance use: Percentage of patients with depression or bipolar disorder with evidence of an initial assessment that includes an appraisal for alcohol or chemical substance use.	Center for Quality Assessment and Improvement in Mental Health	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because the measure does not require a quality action that links to improved outcomes when assessed positive for alcohol or chemical substance use. The measure does not assess a clinical outcome or one of the defined MIPS high priority areas.	
	N/A	369	CMS158v7	eCQM Specifications	Process	Effective Clinical Care	Pregnant women that had HBsAg testing: This measure identifies pregnant women who had an HBsAg (hepatitis B) test during their pregnancy.	OptumInsight	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because the measure steward is no longer maintaining the measure for continued utilization. Furthermore, the measure is evaluating a standard of care as this test would be part of the routine screening for women receiving prenatal care and does not evaluate for care with positive testing results.	
	N/A	373	CMS65v8	eCQM Specifications	Intermediate Outcome	Effective Clinical Care	Hypertension: Improvement in Blood Pressure: Percentage of patients aged 18-85 years of age with a diagnosis of hypertension whose blood pressure improved during the measurement period.	Centers for Medicare & Medicaid Services	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because a similar clinical concept is represented in Measure 236. It is our goal to ensure duplicate measures are not included in the program. In addition, Measure 236 may apply to a larger eligible clinician cohort and offers expanded data submission methods that are not offered by Measure 373.	
	0465	423	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Effective Clinical Care	Perioperative Anti-platelet Therapy for Patients Undergoing Carotid Endarterectomy: Percentage of patients undergoing carotid endarterectomy (CEA) who are taking an anti-platelet agent within 48 hours prior to	Society for Vascular Surgeons	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because the clinical concept is captured within our proposed measure Ischemic Vascular Disease: Use of Aspirin or Anti-platelet Medication. We refer readers to Table A.7 where this measure is proposed. The	

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
						surgery and are prescribed this medication at hospital discharge following surgery.		proposed measure captures all ischemic vascular disease patients that should be receiving an aspirin or anti-platelet medication. Whereas, Measure 423 only captures a subset of the patient population undergoing carotid endarterectomy.
	N/A	426	N/A	MIPS CQMs Specifications	Process	Communication and Care Coordination Post-Anesthetic Transfer of Care Measure: Procedure Room to a Post Anesthesia Care Unit (PACU): Percentage of patients, regardless of age, who are under the care of an anesthesia practitioner and are admitted to a PACU or other non-ICU location in which a post-anesthetic formal transfer of care protocol or checklist which includes the key transfer of care elements is utilized.	American Society of Anesthesiologists	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 97.7 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip .
	N/A	427	N/A	MIPS CQMs Specifications	Process	Communication and Care Coordination Post-Anesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU): Percentage of patients, regardless of age, who undergo a procedure under anesthesia and are admitted to an Intensive Care Unit (ICU) directly from the anesthetizing location, who have a documented use of a checklist or protocol for the transfer of care from the responsible anesthesia practitioner to the responsible ICU team or team member.	American Society of Anesthesiologists	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is considered a standard of care that has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying making this measure extremely topped-out as discussed in section III.I.3.h.(2) of this final rule. The average performance for this measure is 97.9 percent based on the current MIPS benchmarking data available at https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Quality-Benchmarks.zip .
	N/A	447	N/A	MIPS CQMs Specifications	Process	Community/Population Health Chlamydia Screening and Follow-up: The percentage of female adolescents 16 years of age who had a chlamydia screening test with proper follow-up during the measurement period.	National Committee for Quality Assurance	We proposed removal of this measure (finalized in 81 FR 77558 through 77675) because it is duplicative of currently adopted Measure 310: Chlamydia Screening for Women (finalized in 81 FR 77558 through 77675). We strive to not duplicate in the program. This measure is designated as a core performance measure by the Core Quality Measures Collaborative (https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/CoreMeasures.html). Therefore, we

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
								specifically seek comments regarding the impact of removing this measure.
<p>Comment: A commenter supported CMS's proposed removal of 26 MIPS measures and applauded CMS for beginning to use its "Meaningful Measures" framework to streamline the measures used in the MIPS.</p> <p>Response: We thank the commenter for their support.</p> <p>Comment: Several commenters opposed the removal of measure Q048: Urinary Incontinence: Assessment of Presence or Absence of Urinary Incontinence in Women Aged 65 Years. Removing the Urinary Incontinence measure will result in excluding up to half of women with urinary incontinence from quality measurement, resulting in loss of opportunity to improve outcomes. Commenters did not agree that measure Q048 is duplicative in concept and covers the same patient population as currently adopted measure Q050: Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older." Measure Q048 is intended to promote screening for urinary incontinence, recognizing that urinary incontinence is under-reported by patients and under-evaluated by clinicians; measure Q050 is intended to ensure that women who have identified as having urinary incontinence are the evaluated and offered treatment, based on literature showing that patients reporting urinary incontinence are often not evaluated for what is otherwise a treatable condition. The denominator for measure 048 is all women aged 65 years and older, whereas the denominator for measure Q050 is all eligible women already diagnosed with urinary incontinence. Relying on measure Q050 alone for quality measurement related to urinary incontinence will exclude nearly half of women over age 65 that have urinary incontinence but have not been diagnosed. Measures 048 and 050 go hand-in-hand because interventions to increase urinary incontinence screenings (as measured by measure Q048) results in higher numbers of women receiving urinary incontinence treatment (as measured by measure Q050). Having measure Q050 without measure Q048 undermines the purpose of improving outcomes for women with urinary incontinence.</p> <p>Response: After further consideration, we agree with commenters that the denominator for Q050 is not duplicative of Q048 and would not capture the under diagnosis of urinary continence. Therefore, we will not finalize measure Q048 for removal as proposed.</p> <p>Comment: One commenter opposed the CMS proposal to retire three of the eight current Pathology measures: Q099 – Breast Cancer Resection Pathology Reporting Measure, Q100 – Colorectal Cancer Resection Pathology Reporting Measure Q251 - Quantitative Immunohistochemical (IHC) Evaluation of Human Epidermal Growth Factor Receptor 2 Testing (HER2) for Breast Cancer Patients. Removal of these measures would leave pathologists with only five QPP measures whereas the CMS requirement is to report on a minimum of six quality measures. The commenter noted that would significantly hinder successful participation by pathologists in the Quality category.</p> <p>Response: Although we acknowledge that removing these measures limits the number of measures specific to pathology available for reporting, we do believe removing these measures is consistent with our policy to remove measures that have an extremely high performance rate. Based on the 2018 MIPS Benchmark results reflect an average of 99 percent for Q99 and Q251, and 99.5 percent for Q100 which allows limited opportunity to improve clinical outcomes. In the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process.</p> <p>Comment: One commenter supported the removal of measure Q122: Adult Kidney Disease: Blood Pressure Management because it cannot estimate the clinical impact based on the information provided by the measure developers and the measure lost NQF endorsement due to a lack of evidence. This measure does not conform to society guidelines and the measure specifications do not align with clinical recommendations on disease classification. Lastly, the denominator population is burdensome for clinicians to document a care plan for all patients classified as stage 3 and above without evidence to support the benefit of the intervention on clinical outcomes.</p> <p>Response: We thank the commenter for their support to remove measure Q122: Adult Kidney Disease: Blood Pressure Management.</p> <p>Comment: One commenter disagreed with the removal of measure Q122: Adult Kidney Disease: Blood Pressure Management. The commenter stated removal would threaten patient care and disputes that the measure has not been updated nor is planned to be updated.</p> <p>Response: We are continuously working with measure stewards to update the blood pressure values and were not updated in the annual revision cycle. We do not agree that the removal of this measure would threaten patient care. This clinical concept would also be captured in measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented.</p> <p>Comment: One commenter opposed the removal of measure Q156: Oncology: Radiation Dose Limits to Normal Tissues stating, not only do oncology professionals continue to find value in this measure from a patient safety standpoint, they disagree with CMS' contention that it is truly topped out.</p> <p>Response: This measure has a limited opportunity to improve clinical outcomes since performance on this measure is extremely high and unvarying. This does not allow meaningful benchmarks to be established. Based on the 2018 MIPS Benchmark Results, the average performance for this measure is 97.5 percent which does not allow ample opportunity to impact clinical outcomes.</p> <p>Comment: One commenter supported the removal of measure Q163: Comprehensive Diabetes Care: Foot Exam measure from the from the CMS Web Interface collection type. Although the measure is included in the CQMC ACO Core Measure Set, the commenter recognized that measure sets used to evaluate different types of</p>								

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
								<p>clinicians may need to differ to some extent, and did not agree it necessary to use the exact same measures to evaluate clinicians/groups and ACOs. The commenter also noted that this measure is not used in other health plan reporting programs such as MA Star Ratings and the QRS, so its removal from MIPS will not cause misalignment with those programs.</p> <p>Response: We thank the commenter for their support to remove measure Q163: Comprehensive Diabetes Care: Foot Exam from the CMS Web Interface collection type.</p> <p>Comment: One commenter supported removal of measure Q163: Comprehensive Diabetes Care: Foot Care because this measure is duplicative with measure Q126: Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy-Neurological Evaluation. Measure Q126 is the preferred and appropriate measure as it targets an at-risk patient population, is clinically significant, and is in alignment with current clinical guidelines.</p> <p>Response: We thank the commenter for supporting the removal of measure Q163.</p> <p>Comment: One commenter did not support the removal of measure Q163: Comprehensive Diabetes Care: Foot Exam until NQF completes its pending comparison with it and the Diabetes Mellitus: Diabetic Foot and Ankle Care measure (which the proposed rule suggests it duplicates). NQF found no significant difference in the measures' ability to identify the at-risk population or in the components of clinical assessment specified in them. More than 10,000 clinicians in NCQA's Diabetes Recognition Program report Comprehensive Diabetes Care: Foot Exam. The measure also is in the Core Quality Measures Collaborative ACO/PCMH and Primary Care set, which CMS described as "a major step forward" for quality measure alignment" and a "framework upon which future efforts can be based."</p> <p>Response: We agree with the commenter's statement indicating that both measures' ability to identify the at-risk population or in the components of clinical assessment specified in them. Both measures aim to promote appropriate foot examination to identify risk factors predictive of ulcers and amputations. However, measure Q126 requires the frequency of the exam to be increased if abnormalities are present. More frequent evaluation of the diabetic foot is recommended depending on risk category. It is through systematic examination and risk assessment, patient education, and timely referral that eligible clinicians may further reduce the unnecessarily high prevalence of lower-extremity morbidity in the diabetes population. We attempt to align with CQMC, but believe this is duplicative of a more robust measure. As MIPS moves forwards, we will continue to explore ways to align measurement across programs.</p> <p>Comment: A commenter did not support removal of the Q185: Colonoscopy Interval for Patients with a History of Adenomatous Polyps – Avoidance of Inappropriate Use measure. The commenter noted that updated guidelines on the appropriate follow-up interval for patients with a history of adenomatous polyps are set to be released in the near future. The commenter also noted that it is likely that the measure specifications will be updated at that point, which may alter clinician performance. The commenter recommended that CMS retain the measure in MIPS until it is able to review other stakeholder concerns about measure performance, and that CMS work with the measure developer to update the MIPS measure specifications when new guidelines are released.</p> <p>Response: We agree that updated guidelines could affect the performance of this measure causing the measure to have a substantive change and therefore may no longer have a benchmark that is considered to be topped out. We note this measure shows a 97.7 percent average performance for Medicare Part B Claims Measure Specifications while the MIPS CQMs Specification (registry) version shows less than 97 percent average performance rate. Based on our extremely topped out measure removal policy, we intend to only remove this measure from the Medicare Part B Claims Measure Specification collection type for the 2019 performance period. We will not finalize the removal of MIPS CQM collection type. We will work with the measure steward to update for the new clinical guidelines once those are released and continue to monitor the performance of the MIPS CQM Measure Specification in the future.</p> <p>Comment: Several commenters supported the proposed removal of the Q204: Ischemic Vascular Disease: Use of Aspirin or Another Anti-Platelet measure.</p> <p>Response: We thank the commenters for their support to remove measure Q204: Ischemic Vascular Disease: Use of Aspirin or Another Anti-Platelet measure.</p> <p>Comment: Several commenters were concerned about the removal of Q204: Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet because its specialties have identified this measure as a high-priority measure, and therefore, requested the measure not be removed. Another commenter disagreed with removal of Q204 as the Million Hearts Campaign, Core Quality Measures Collaborative ACO/PCHM and Primary Care set and many other public and private programs use this measure.</p> <p>Response: We originally proposed a replacement measure that included appropriate denominator exceptions, but ultimately decided it was duplicative of measure Q441: Ischemic Vascular Disease All or None Outcome Measure (Optimal Control). Therefore, to be consistent with our policy to remove measures that are duplicative to other measures and to ensure measures are more meaningful, we have decided to not finalize inclusion of this new IVD measure. In addition, it would introduce a measure that was not aligned with the Million Hearts Campaign, Core Quality Measures Collaborative ACO/PCHM and Primary Care set. We will finalize the proposal to remove Q204. Measure Q204 is duplicative and does not have appropriate denominator exceptions/exclusions to account for patients who are not appropriate for aspirin or antiplatelet therapy (that is, history of gastrointestinal bleeding, intracranial bleeding, bleeding disorder, allergy to aspirin or anti-platelets, or use of non-steroidal anti-inflammatory agents). We encourage the commenters to submit the outcome measure that addresses this concept.</p> <p>Comment: One commenter expressed concern on the proposed removal of measures Q224: Melanoma: Avoidance of Overutilization of Imaging Studies and Q156: Oncology: Radiation Dose Limits to Normal Tissues without proposing new oncology-related measures to replace them. CMS should also be mindful of the need to ensure an adequate number of applicable measures for oncologists and other specialty groups when proceeding with decisions about measure removal.</p> <p>Response: We refer the commenter to review the Oncology specialty measure set that provides a narrowed list of measures applicable to the oncology specialty. The specialty measure sets are reviewed annually by stakeholders to include applicable measures. The oncology measure set contains 24 quality measures.</p> <p>Comment: Two commenters opposed the removal of measure Q276: Sleep Apnea: Assessment of Sleep Symptoms; and the adoption of measure Q277: Severity Assessment at Initial Diagnosis. One commenter noted that Q277 focuses on care provided to patients with a diagnosis of obstructive sleep apnea, and that many</p>

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
								<p>patients with neurologic disorders experience sleep disturbances and disorders other than obstructive sleep apnea. They also noted that removing Q276 would result in limited reporting options for neurologists specializing in sleep care. They stated also that while it may be easier to see the value in calculating the severity of sleep apnea, as required in measure Q277; that in accordance with evidence-based Clinical Practice Guideline for Diagnostic Testing for Obstructive Sleep Apnea, diagnostic testing for obstructive sleep apnea should be performed in conjunction with a comprehensive sleep evaluation and adequate follow-up. One of the commenters noted that patients with untreated obstructive sleep apnea are also at an increased risk of being diagnosed with cardiovascular disease, difficult-to-control blood pressure, coronary artery disease, congestive heart failure, arrhythmias, and stroke. They stated further that sleep medicine professionals need relevant measures to report for participation in the MIPS program, and currently there are only four sleep medicine measures available.</p> <p>Response: These measures address the same patient population; however, Q276, does not identify a standardized tool to assess sleep symptoms whereas Q277 defines a standard method of assessment. This allows clinicians a baseline to assess if the patient is being treated appropriately. A non-standardized assessment of daytime sleepiness may be circumstantial and may not be a reliable indicator of appropriate treatment. In addition, the measure Q276 does not have a quality action if the patient is experiencing daytime sleepiness. We agree with the commenters' suggestions that sleep apnea should be performed in conjunction with a comprehensive sleep evaluation and adequate follow-up. The Q276 measure does not address the adequate follow-up component to mitigate the risks of cardiovascular disease, difficult-to-control blood pressure, coronary artery disease, congestive heart failure, arrhythmias, and stroke. We encourage the commenters to collaborate with measure developers to submit new measures that address sleep apnea in the Call for Measures process. In the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process.</p> <p>Comment: One commenter opposed removal of Q278 Sleep Apnea: Positive Airway Pressure Prescribed and requested that the measure be categorized as a high priority patient safety measure, given the overwhelming amount of evidence in the medical literature describing the negative effects of untreated sleep disorders. They noted that patients with untreated obstructive sleep apnea are also at an increased risk of being diagnosed with cardiovascular disease, difficult-to-control blood pressure, coronary artery disease, congestive heart failure, arrhythmias, and stroke. They stated further that sleep medicine professionals need relevant measures to report for participation in the MIPS program, and currently there are only four sleep medicine measures available.</p> <p>Response: We are attempting to reduce reporting burden where measures are duplicative in concept or do not drive quality action by eligible clinician. We believe that this measure is low bar and choose to continue to implement measure Q279 is more robust and requires assessment of adherence to the therapy. Measure Q278 does not assess a clinical outcome nor one of the defined MIPS high priority areas. We encourage the commenters to collaborate with measure developers to submit new measures that address sleep apnea in the Call for Measures process. In the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process.</p> <p>Comment: One commenter opposed removal of measure Q327: Pediatric Kidney Disease: Adequacy of Volume Management. This measure meets several national quality strategy domains – clinical care, care coordination, and patient and caregiver experience and removal of this measure would leave only one MIPS measure for pediatric nephrologists. A second commenter also opposed the removal of measure Q327 because they noted that despite the small number of Medicare pediatric patients, many pediatric nephrologists do not meet the low volume threshold and are still required to participate in the Quality Payment Program. The commenter also noted also that very few measures exist that allow pediatric nephrologists to participate meaningfully. They requested CMS not to eliminate this or any other pediatric kidney disease measures from the Quality Payment Program unless and until they can be replaced with other measures specific to pediatric kidney disease.</p> <p>Response: Although, we acknowledge that removing this measure limits the number of measures specific to pediatric nephrologists available for reporting, we do believe removing this measure is consistent with our policy to move towards more meaningful measures and decrease burden for eligible clinicians. This is a process measure that does not assess if there the patient had appropriate volume management, but whether the adequacy was assessed. As we move toward more outcome-based measures, we suggest the commenter to collaborate with measure stewards to develop an outcome measure that the patient aligns with the post dialysis weight. In addition, although there are not many specific measures available, there are cross-cutting measures that we believe would be applicable to pediatric nephrologists and could be submitted. This measure is only available by CQM Measure Specification, and therefore, in the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality performance category score may be adjusted through the measure validation process as applicable.</p> <p>Comment: One commenter did not support the choice to remove the Q334: Adult Sinusitis CT scan measure because they noted that CMS did not follow the established process of utilizing a 4-year, step-down period for removing topped out measures. The commenter requested that CMS follow this process so that measure stewards are able to plan accordingly for other measure development before an existing measure is retired.</p> <p>Response: By removing these extremely topped out measures, we are attempting to reduce reporting burden where there is little room for improvement. Additionally, this allows eligible clinicians to maximize their potential quality performance category score. Based on the 2018 Benchmark File, this measure only supported the creation of deciles 3 to 5, which would limit the score awarded for the measure.</p> <p>Comment: One commenter opposed removal of measure Q359: Optimizing Patient Exposure to Ionizing Radiation: Utilization of a Standardized Nomenclature for Computed Tomography (CT) Imaging measure because they did not agree that it is duplicative of Q361: OPEIR - Reporting to a Dose Index Registry, which they noted is only intended to enable reporting to a dose index registry to allow comparison across radiology sites. They stated that removing this measure may affect some radiologists' ability to meet quality measure requirements.</p> <p>Response: Standardized nomenclature permits data mining in order to participate in research projects, registries, and quality improvement efforts. This facilitates a first step toward structured reporting to Radiation Dose Index Registries, which would be captured in measure Q361: Optimizing Patient Exposure to Ionizing Radiation: Reporting to a Radiation Dose Index Registry. Even with the removal of this measure, the Radiology specialty measure set has more than 6 quality measures. In the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality</p>

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
								<p>performance category score will be adjusted accordingly through the measure validation process.</p> <p>Comment: One commenter opposed the removal of measure Q363: Optimizing Patient Exposure to Ionizing Radiation: Search for Prior Computed Tomography (CT) Studies Through a Secure, Authorized, Media-Free, Shared Archive. The commenter respectfully suggested that CMS fails to appreciate the process upon which this measure has impact. It is correct that referring clinicians place orders, but radiologists would complete the exams. The measure quality action is that prior to performing the ordered exam, the radiologist would search existing image exchanges across institutions or geographic area for existing prior images for the patient. The potential improved outcome would be a reduction in patient exposure to radiation, as well as a substantial reduction when duplicative imaging procedures are avoided. Additionally, broader access to existing imaging studies, including relevant prior images used for comparative purposes of patient history (of lesions for example) could improve diagnostic specificity and accuracy for radiologists and potentially further minimize recommendations for follow-up studies. In addition, they stated that removing this measure may affect some radiologists' ability to meet quality measure requirements.</p> <p>Response: While we appreciate the intent to review historical images and reduce radiation, the measure requires a finalized report of a CT study to be denominator eligible. Therefore, it would exclude instances where the duplicative CT was appropriately cancelled as they would no longer be denominator eligible. An eligible clinician can be numerator compliant if a CT was completed and had identified a prior CT exam. Therefore, it does not promote radiation reduction. Even with the removal of this measure, the Radiology specialty measure set has more than 6 quality measures. In the event an eligible clinician reports on less than 6 quality measures because no other measures in the set are available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process.</p> <p>Comment: One commenter opposed removal of measure Q373: Hypertension: Improvement in Blood Pressure measure because of its impact on patient care and low reporting burden. They noted that the data is already documented in the EHR as part of standard workflows. One commenter agreed that measure Q373: Hypertension: Improvement in Blood Pressure provides no incremental benefit over measure Q236. However, the commenter expressed concern that a one-size-fits-all SBP goal of < 140/90 mm Hg may suggest to patients and their healthcare providers that their treatment is adequate if they reach this goal. In the future, as further evidence accumulates for other cohorts of patients, the commenter hoped a more comprehensive set of blood pressure control measures that are tailored to patients' cardiovascular risk will become available for CMS reporting.</p> <p>Response: We are committed to our goal to remove measures that are duplicative to other measures and to be consistent with ensuring measures are more meaningful. As we indicated in our proposal, this measure is very similar in clinical concept to measure Q236: Controlling High Blood Pressure. We believe measure Q236 may apply to a larger eligible clinician cohort and offers expanded collection types that are not offered by measure Q373. Both measures are available via eCQM Specifications, and therefore, measure Q236 would have a low reporting burden since the data is already documented in the EHR as indicated by the commenter. In addition, we will continue to work with measure stewards to update the current blood pressure measures to align with clinical guidelines as appropriate or evaluate potential new measures to propose for the program.</p> <p>Comment: One commenter expressed concerns about Appendix Table C and that it is premature to remove measures for which replacement measures are concurrently being proposed, (for example, Falls Screening and Functional Status Assessment for Total Knee Replacement), until vendors have had the necessary time to develop, certify and deploy their respective replacement measures.</p> <p>Response: We provided a measure preview this year to allow for technical revisions, this also allowed vendors to gather preliminary implementation strategies. Additionally, all measure finalized will be posted on the CMS website prior to the start of the 2019 performance period. We also aim to reduce the number of duplicative measures. If we retain the Functional Status Assessment for Total Knee Replacement for the 2019 performance period, this would be duplicated measure concept of measure Q470: Average Change in Functional Status Following Total Knee Replacement Surgery.</p> <p>Comment: Two commenters did not support removal of Q386: Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences from this measure set. The commenters appreciated the effort to decrease redundancy between this measure and the Q047 Advance Care Plan measure. While these measures do overlap, the commenters noted that ALS measure specification recognizes the likely earlier age of onset of this devastating diagnosis and the need to have earlier planning conversations around palliative and end of life care by having no minimum age requirement. For this reason, the commenter believed the measure should be retained.</p> <p>Response: We agree with the commenters concerns about removing measure Q386 and will not finalize this measure for removal. Specifically, we agree that patients with ALS are often younger than those in the denominator for Measure 047, which includes patients age 65 and older. For this reason, we concur with commenters that a separate measure applying to all patients with a diagnosis of ALS is clinically indicated.</p> <p>Comment: One commenter did not support the removal of measure Q426: Post-Anesthetic Transfer of Care Measure: Procedure Room to a Post Anesthesia Care Unit (PACU) and measure Q427: Post-Anesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU). Their removal would jeopardize many anesthesiologists' opportunities to report the required six quality measures. The anesthesiology measure set currently includes seven anesthesia-specific measures and a handful of measures that are only reportable using evaluation and management codes—codes that are rarely reported by anesthesiologists. For anesthesiologists working in ambulatory settings and on surgeries lasting less than one hour, the number of applicable measures would be reduced to just one measure. In previous years, CMS correctly identified measures Q426 and Q427 as high-priority measures. The proposed removal of these measures would expose contradictions between CMS' intent to improve communication and care coordination with the removal of measures aimed at ensuring communication between clinicians. When considering Advanced Alternative Payment Models (APMs), and the need for entities to use measures comparable to MIPS, these two measures should be identified by those Advanced APMs as helping to reduce medical errors, adverse medication events, expedite recovery and reduce costs.</p> <p>Response: Measures Q426: Post-Anesthetic Transfer of Care Measure: Procedure Room to a Post Anesthesia Care Unit (PACU) and Q427: Post-Anesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU) are being removed as they have limited opportunity to produce clinical outcomes as the performance rates are extremely topped out. By removing these extremely topped out measures, we are attempting to reduce reporting burden where there is little room for improvement. In the event an eligible clinician reports on less than 6 quality measures, because no other measures in the set are</p>

TABLE C: Quality Measures Finalized for Removal in the 2021 MIPS Payment Year and Future Years

NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
								<p>available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process. We agree that promoting communication between clinician is important, the performance data does not support a gap in communication and drive quality improvement in this area. We encourage the commenter to work with measure developers to create a measure that promotes communication that addresses current gap in the anesthesia specialty.</p> <p>Comment: Another commenter did not support removal of topped out measures: Q426: Post-Anesthetic Transfer of Care Measure: Procedure Room to a Post Anesthesia Care Unit (PACU) and Q427: Post-Anesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU). The commenter was concerned about removal of these measures as they relate to CRNAs. Without a concerted effort to expand measure specifications to include non-patient facing CPT codes, the commenter recommended that measures attributed to non-patient facing clinicians be excluded from the removal process to assure that CRNAs do not face additional burden by not having enough applicable measures to participate in MIPS.</p> <p>Response: Measures Q426: Post-Anesthetic Transfer of Care Measure: Procedure Room to a Post Anesthesia Care Unit (PACU) and Q427: Post-Anesthetic Transfer of Care: Use of Checklist or Protocol for Direct Transfer of Care from Procedure Room to Intensive Care Unit (ICU) are being removed as they have limited opportunity to produce clinical outcomes as the performance rates are extremely topped out. By removing these extremely topped out measures, we are attempting to reduce reporting burden where there is little room for improvement. In the event a CRNA reports on less than 6 quality measures, because no other measures in the set are available or applicable to their scope of practice, the quality performance category score will be adjusted accordingly through the measure validation process. With the measure validation process in place, we do not agree with the commenter to maintain all non-patient facing measures.</p> <p>Comment: Two commenters supported removal of the Q447: Chlamydia Screening and Follow-Up measure from the MIPS program. Although the measure proposed for removal is included in the CQMC OB/GYN Core Measure Set, the measure that CMS proposes to retain in MIPS, Q310: Chlamydia Screening in Women, is also a CQMC measure. The commenters agreed that the measure proposed to be retained provides more comprehensive quality information, as it includes a wider age range compared to the measure that would be remove and is limited to patients identified as sexually active.</p> <p>Response: We thank the commenters for their support.</p> <p>Comment: One commenter stated that they support CMS' outline of removal criteria to be considered when removing a measure. However, the commenter also requested that CMS evaluate measures for removal based on the collection type. For example, they noted that several eCQMs proposed for removal due to a duplicative measure being available; however, in most instances, that duplicative measure is not available as an eCQM. This would potentially force practices to maintain relationships and pay for reporting through multiple vendors to maintain their list of measures. Specifically, this affects the proposed removal of eCQMs Q163 (Comprehensive Diabetes Care: Foot Exam), Q204 (Ischemic Vascular Disease (IVD): Use of Aspirin or Another Antiplatelet), Q318 (Falls: Screening for Future Fall Risk), and Q375 (Functional Status Assessment for Total Knee Replacement: Changes to the measure description). Another commenter expressed similar concerns about removal of Q373: Hypertension: Improvement in Blood Pressure: Percentage of patients aged 18-85 years of age with a diagnosis of hypertension whose blood pressure improved during the measurement period.</p> <p>Response: In response to this concern, we conducted an analysis of the measures proposed for removal with an eCQM collection type. As a result of this analysis, we concluded that we will not finalize measures Q012, Q318, and Q375 for removal because there is not an eCQM collection type offered in the measures that we proposed as duplicative measures. With regard to updating the removal criteria to consider data collection type overall, we will take this into consideration as we refine future removal criteria.</p> <p>FINAL ACTION: We are finalizing the removal of these measures as proposed for the 2019 Performance Period and future years with the exception of the following measures: Q012, Q048, Q154, Q155, Q185, Q318, Q375 and Q386. Our decisions to not finalize these measures for removal in this final rule are detailed in our responses above to the public comments for these measures. Note: The new measure "Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls" will not be finalized for inclusion in this final rule because the measure steward believes it is not implementable at this time. Therefore, the three falls measures (Q154, Q155 and Q318) will remain in the program for the 2019 performance period because they are important to evaluate for high-risk of falling.</p>

TABLE Group D: Measures with Substantive Changes Finalized for the 2021 MIPS Payment Year and Future Years

D.1. Medication Reconciliation Post-Discharge

Category	Description
NQF #:	0097
Quality#:	046
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	<p>The percentage of discharges from any inpatient facility (for example hospital, skilled nursing facility, or rehabilitation facility) for patients 18 years and older of age seen within 30 days following discharge in the office by the physician, prescribing practitioner, registered nurse, or clinical pharmacist providing on-going care for whom the discharge medication list was reconciled with the current medication list in the outpatient medical record.</p> <p>This measure is reported as three rates stratified by age group:</p> <ul style="list-style-type: none"> • Submission Criteria 1: 18-64 years of age • Submission Criteria 2: 65 years and older • Total Rate: All patients 18 years of age and older
Substantive Change:	Modified collection type: Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We removed the CMS Web Interface Measure Specifications collection type. This is a process measure, which promotes care coordination when transitioning from an inpatient facility to outpatient care. Removal of this measure from the CMS Web Interface supports our effort to move towards outcome and more meaningful measures within the CMS Web Interface. In addition, since clinicians are required to report all available CMS Web Interface measures, removing this measure from the CMS Web Interface will reduce the burden of the number of measures a clinician is required to report under the CMS Web Interface. This measure is broadly applicable to eligible clinicians participating in the MIPS program using the collection types of Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications. Retaining this measure through the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types allows clinicians to choose this measure as one of the six measures clinicians are generally required to report to meet the quality performance category requirements.</p>
<p>Comment: Commenters indicated that CMS should retain this measure because ensuring clinicians are reconciling patient medications limits the occurrence of adverse drug events for elderly patients with multiple co-morbidities and prescription medications.</p> <p>Response: This is a process measure that promotes care coordination when transitioning from an inpatient facility to outpatient care. While we agree that medication reconciliation is an important aspect of care coordination and avoiding adverse drug events, we believe a more broadly applicable measure that does not just focus on medication reconciliation post discharge would more effectively promote care coordination. In addition, since clinicians are required to report all available CMS Web Interface measures, removing this measure from the CMS Web Interface will reduce the burden of the number of measures a clinician is required to report under the CMS Web Interface. We do not believe removing this measure from one collection type, CMS Web Interface, will increase the occurrence of adverse drug events because eligible clinicians have the opportunity to report this measure as a Medicare Part B Claims Measure Specification or MIPS CQMs Specification.</p> <p>Comment: In addition, several commenters expressed general concerns that the measures we proposed to remove from the CMS Web Interface would continue to be used in other programs or that they would remain available to report to MIPS via other reporting mechanisms, creating inconsistency in the available measure set by reporting mechanism. One commenter expressed concerns about removal of the CMS Web Interface and its impact on the Medicare Shared Savings Program and ACO participants that utilize this data collection method for this measure.</p> <p>Response: We acknowledge that measures proposed for removal from the CMS Web Interface may continue to be required by other programs and available by other collection types. However, removing them from the CMS Web Interface would reduce burden on MIPS groups and ACO participants by removing the requirement that they actively submit the measure performance data through the CMS Web Interface. For MIPS groups, we are removing this measure to reduce burden of reporting the required measure set. However, we are retaining this measure through the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types to allow clinicians an opportunity to report this measure as one of the six measures to meet the quality performance category requirements.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q046 as proposed for the 2019 Performance Period and future years.</p>	

D.2. Pneumococcal Vaccination Status for Older Adults

Category	Description
NQF #:	N/A
Quality#:	111
CMS eCQM ID:	CMS127v7
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 65 years of age and older who have ever received a pneumococcal vaccine
Substantive Change:	Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	We removed the CMS Web Interface Measure Specifications collection type. This measure has lost NQF endorsement and no longer reflects the current guidelines. A new measure is under development to reflect current guidelines and may be proposed in the future. In addition, since clinicians are required to report all available CMS Web Interface measures, removing this measure from the CMS Web Interface will reduce the burden of the number of measures a clinician is required to report under the CMS Web Interface. This measure is broadly applicable to eligible clinicians participating in the MIPS program using the collection types of Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications, and eCQM specifications. Retaining this measure through the Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications, and eCQM specification collection types allows clinicians to choose this measure as one of the six measures clinicians are generally required to report to meet the quality performance category requirements. We encourage stakeholders to submit a replacement measure for future consideration that is in alignment with the most current clinical guidelines.
<p>Comment: Several commenters opposed the removal of the CMS Web Interface Measure Specifications collection type for this measure. The commenter recommended that CMS works toward immediately replacing the measure with another similar (and endorsed) measure which will lead to the capture of comprehensive care of elderly patients. They noted that complete removal and no replacement of this measure will lessen the incentive and urgency for ACOs to administer this life saving vaccination, resulting in fewer patients vaccinated, and leading to worsened outcomes and higher costs.</p> <p>Response: We agree on the importance of a pneumonia vaccination measure. However, we believe the burden to submit this measure via the CMS Web Interface and the loss of NQF endorsement aligns with our goal to be less burdensome for clinicians and ensure measures are still supported by the current clinical guidelines. Furthermore, we acknowledge that pneumonia vaccination is an important preventive clinical intervention, but measure Q111 does not address current pneumonia vaccination guidelines. We believe maintaining the measure under other collection types to provide an option to select a measure that addresses important population health matter. However, until this measure can be replaced with a measure promoting pneumococcal vaccination, we believe it should not be required to be submitted via the CMS Web Interface. Eligible clinicians submitting Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications are able to select quality measures that are applicable to their specialty that are meaningful to their practice. In the CMS Web Interface, all measures are required; therefore, some eligible clinicians may believe the measure to be burdensome since it does not fully align with the current pneumococcal vaccination schedule.</p> <p>Comment: A few commenters expressed concern that the measures we proposed to remove from the CMS Web Interface would continue to be used in other programs or that they would remain available to report to MIPS via other reporting mechanisms, creating inconsistency in the available measure set by reporting mechanism.</p> <p>Response: We acknowledge that measures proposed for removal from the CMS Web Interface may continue to be required by other programs and available by other collection types. However, removing them from the CMS Web Interface would reduce burden on MIPS groups and ACO participants by removing the requirement that they actively submit the measure performance data through the CMS Web Interface. Specific to ACO participants, ACOs can track these additional metrics in order to participate in the Shared Savings Program and potentially earn shared savings. We note, however, that one of the advantages of clinician participation in a Shared Savings Program ACO is that the ACO reports quality on the clinicians' behalf, reducing clinician burden. We believe that this streamlined approach benefits ACOs in reducing program complexity and enables CMS to make meaningful comparisons on a consistent measure set, across ACOs who are eligible to share in any earned savings or may be responsible for any owed losses, based on that performance. For MIPS groups, we are removing this measure to reduce burden of reporting the required measure set. However, we are retaining this measure through the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types to allow clinicians an opportunity to report this measure as one of the six measures to meet the quality performance category requirements.</p> <p>Comment: One commenter stated that measure Q111: Pneumococcal Vaccination Status for Older Adults is aligned with the CMS Meaningful Measures Framework and is a high-impact measure. The commenter did not agree with CMS' concern that the measure is not aligned with ACIP pneumococcal vaccination recommendations. The commenter requested that CMS retain the current pneumococcal vaccination measure until such time as it can be updated with new measure(s).</p> <p>Response: We agree that the measure addresses an important population health matter and encourage measure developers to submit an updated measure through the Call for Measures process. Please note that we are retaining this measure in the MIPS program and this substantive change only relates to the removal of the CMS Web Interface data collection method. The removal of the CMS Web Interface was proposed to reduce burden on MIPS groups and ACO participants by removing the requirement that they actively submit the measure performance data through the CMS Web Interface. We maintain the concern that it is not in complete alignment with the ACIP recommendations. The measure specification only requires one dose ever documented, either the PCV13 or PPSV23 vaccine (or both). According to ACIP recommendations, patients should receive both vaccines. The order and timing of the vaccinations depends on certain patient characteristics, and are described in more detail in the ACIP recommendations.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q111 as proposed for the 2019 Performance Period and future years. Please note that the following</p>	

Category	Description
	technical changes were also made to this measure: The CMS eCQM ID changed from “CMS127v6” to “CMS127v7.” The NQF# changed from “0043” to “N/A” due to loss of NQF endorsement. These changes were also applied to specialty measure sets in Table Group B where this measure was included.

D.3. Diabetes: Eye Exam

Category	Description
NQF #:	0055
Quality #:	117
CMS eCQM ID:	CMS131v7
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 18-75 years of age with diabetes who had a retinal or dilated eye exam by an eye care professional during the measurement period or a negative retinal exam (no evidence of retinopathy) in the 12 months prior to the measurement period
Substantive Change:	Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	We removed the CMS Web Interface Measure Specifications collection type. This measure evaluates a process in the care for the patient. Removal of this measure from the CMS Web Interface Measure Specifications supports our effort to move towards outcome and meaningful measures. In addition, since clinicians are required to report all available CMS Web Interface measures, removing this measure from the CMS Web Interface will reduce the burden of the number of measures a clinician is required to report under the CMS Web Interface. This measure is broadly applicable to eligible clinicians participating in the MIPS program using the collection types of Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications, and eCQM specifications. Retaining this measure through the Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications, and eCQM specification collection types allows clinicians to choose this measure as one of the six measures clinicians are generally required to report to meet the quality performance category requirements
<p>Comment: One commenter opposed the elimination the CMS Web Interface Measure Specifications collection type for this measure as regular exams are vital to preventing unnecessary vision loss.</p> <p>Response: We believe this measure would be burdensome to require all eligible clinicians using the CMS Web Interface to submit this measure. All measures included in the CMS Web Interface are required to be submitted even if the measure may not apply to a particular specialty. We are maintaining the measure under other collection types to provide an option to select a measure that addresses important process in diabetes care. Eligible clinicians submitting Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications are able to select quality measures that are applicable to their specialty that are meaningful to their practice. In the CMS Web Interface, all measures are required, therefore some eligible clinicians may believe the measure to be burdensome.</p> <p>Comment: A few commenters expressed concern that the measures we proposed to remove from the CMS Web Interface would continue to be used in other programs or that they would remain available to report to MIPS via other reporting mechanisms, creating inconsistency in the available measure set by reporting mechanism.</p> <p>Response: We acknowledge that measures proposed for removal from the CMS Web Interface may continue to be required by other programs and available by other collection types. However, removing them from the CMS Web Interface would reduce burden on MIPS groups and ACO participants by removing the requirement that they actively submit the measure performance data through the CMS Web Interface. Specific to ACO participants, ACOs can track these additional metrics in order to participate in the Shared Savings Program and potentially earn shared savings. We note, however, that one of the advantages of clinician participation in a Shared Savings Program ACO is that the ACO reports quality on the clinicians' behalf, reducing clinician burden. We believe that this streamlined approach benefits ACOs in reducing program complexity and enables CMS to make meaningful comparisons on a consistent measure set, across ACOs who are eligible to share in any earned savings or may be responsible for any owed losses, based on that performance. For MIPS groups, we are removing this measure to reduce burden of reporting the required measure set. However, we are retaining this measure through the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types to allow clinicians an opportunity to report this measure as one of the six measures to meet the quality performance category requirements.</p> <p>FINAL ACTION: We are finalizing measure Q117: <i>Diabetes: Eye Exam</i> as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure: The CMS eCQM ID changed from "CMS131v6" to "CMS131v7." These changes were also applied to specialty measure sets in Table Group B where this measure was included.</p>	

D.4. Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan

Category	Description
NQF #:	0421
Quality #:	128
CMS eCQM ID:	CMS69v7
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a BMI documented during the current encounter or during the previous 12 months AND with a BMI outside of normal parameters, a follow-up plan is documented during the encounter or during the previous 12 months of the current encounter. Normal Parameters: Age 18 years and older BMI ≥ 18.5 and < 25 kg/m ² .
Substantive Change:	Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications Updated the denominator exception logic: for the eCQM Specifications collection type to allow medical reasons for not obtaining the BMI.
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We removed the CMS Web Interface Measure Specifications collection type. This measure evaluates a process in the care for the patient. Removal of this measure from the CMS Web Interface Measure Specifications supports our effort to move towards outcome and meaningful measures. In addition, since clinicians are required to report all available CMS Web Interface measures, removing this measure from the CMS Web Interface will reduce the burden of the number of measures a clinician is required to report under the CMS Web Interface. This measure is broadly applicable to eligible clinicians participating in the MIPS program using the collection types of Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications, and eCQM specifications. Retaining this measure through the Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications, and eCQM specification collection types allows clinicians to choose this measure as one of the six measures clinicians are generally required to report to meet the quality performance category requirements.</p> <p>We updated the denominator exception logic for the eCQM Specifications collection type to allow medical reasons for not obtaining the BMI. The Technical Expert Panel (TEP) convened by the measure steward recommended adding a medical reason as there could be valid medical reasons for not obtaining the BMI. We agree with the TEP to add a medical exception. There are valid medical reasons that may inhibit the eligible clinicians from obtaining a BMI. Specifically, CMS69v6 has denominator exceptions for medical reasons for not providing the follow-up plan. These exceptions are currently expressed as “Intervention, Order not done” and “Medication, Order not done”. The updated measure, CMS69v7, adds an exception to remove patients from the denominator who have a medical reason for not having a BMI performed. This exception was added to account for patients for whom it may be physically difficult to conduct a BMI, such as patients who are unable to stand or for whom their weight exceeds scale limits. This update will provide eligible clinicians the opportunity to exclude patients when there is an appropriate medical reason documented.</p>
<p>Comment: One commenter suggested that BMI screening and follow-up is an important metric since weight loss and gain are symptoms of some mental health disorders and patients with serious mental illness face increased risks for obesity and early death from medical co-morbidities as a side-effect of psychotropic medications. One commenter supported the updates to this measure. Another commenter suggested that elimination of this measure would impact the long-term importance of assessing clinician performance related to population health.</p> <p>Response: We agree that obesity-related care is important; however, we believe that this issue will continue to be addressed under several of the measures that remain in the CMS Web Interface and SSP measure set, for example the 30 day all-cause readmission measure, and the hypertension, statin, diabetes measures.</p> <p>Comment: A few commenters expressed concern that the measures we proposed to remove from the CMS Web Interface would continue to be used in other programs or that they would remain available to report to MIPS via other reporting mechanisms, creating inconsistency in the available measure set by reporting mechanism.</p> <p>Response: We acknowledge that measures proposed for removal from the CMS Web Interface may continue to be required by other programs and available by other collection types. However, removing them from the CMS Web Interface would reduce burden on MIPS groups and ACO participants by removing the requirement that they actively submit the measure performance data through the CMS Web Interface. Specific to ACO participants, ACOs can track these additional metrics in order to participate in the Shared Savings Program and potentially earn shared savings. We note, however, that one of the advantages of clinician participation in a Shared Savings Program ACO is that the ACO reports quality on the clinicians’ behalf, reducing clinician burden. We believe that this streamlined approach benefits ACOs in reducing program complexity and enables CMS to make meaningful comparisons on a consistent measure set, across ACOs who are eligible to share in any earned savings or may be responsible for any owed losses, based on that performance. For MIPS groups, we are removing this measure to reduce burden of reporting the required measure set. However, we are retaining this measure through the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types to allow clinicians an opportunity to report this measure as one of the six measures to meet the quality performance category requirements.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q128 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure: The CMS eCQM ID changed from “CMS69v6” to “CMS69v7.” These changes were also applied to specialty measure sets in Table Group B where this measure is included.</p>	

D.5. Oncology: Medical and Radiation – Plan of Care for Moderate to Severe Pain

Category	Description
NQF #:	0383
Quality #:	144
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having moderate to severe pain with a plan of care to address pain documented on or before the date of the second visit with a clinician
Substantive Change:	<p>The new numerator is revised to read: Patients for whom a plan of care to address moderate to severe pain is documented on or before the date of the second visit with a clinician.</p> <p>Updated the denominator to clearly state that population for this measure would be limited to patients who had moderate to severe pain.</p> <p>The new denominator is revised to read: All patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy who report having moderate to severe pain or All patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy.</p>
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We modified the numerator to state that the plan of care for pain management should be documented in the first 2 visits (not at any point during the performance period). The current measure requires the plan of care to be documented at any time during the performance period.</p> <p>We modified the denominator to clearly state that the population for this measure would be limited to patients who had moderate to severe pain.</p> <p>Pain severity continues to remain largely unaddressed, especially in those patients who have moderate/severe pain. The edits to this measures numerator would ensure that the oncologist documents a plan of care early, so as to ensure that patients who have moderate to severe pain know what pain management options are available to them earlier on when receiving chemotherapy and radiation, and can become engaged early on in their healthcare decisions. The update to the numerator is based on American Society of Clinical Oncology feedback on the measure by Quality Oncology Practice Initiative registry users who realize that the measure should focus on this to ensure quality of life via pain management is improved in cancer patients.</p>
<p>Comment: One commenter supported the changes to this measure.</p> <p>Response: We thank the commenter for their support.</p> <p>FINAL ACTION: We are not finalizing the changes to measure Q144 as proposed for the 2019 Performance Period and future years because, upon reviewing the steward's test results for the proposed numerator and denominator changes, NQF determined that the measure steward's testing data was insufficient. As a result, the NQF has requested that the measure steward retest these changes with sufficient data. Therefore, we will retain the current 2018 numerator and denominator specifications for this measure, as follows:</p> <p>Numerator: Patient visits that included a documented plan of care to address pain Denominator: All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain.</p> <p>Please note that, although the proposed substantive changes are not finalized, the following technical changes were made to this measure for further accuracy based on feedback from the measure steward: The Measure Title was changed from "Medical and Radiation – Plan of Care for Pain" to "Medical and Radiation – Plan of Care for Moderate to Severe Pain." This change was applied to specialty measure sets in Table Group B where this measure is included.</p>	

D.6. Rheumatoid Arthritis (RA): Tuberculosis Screening

Category	Description
NQF #:	N/A
Quality #:	176
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have documentation of a tuberculosis (TB) screening performed and results interpreted within 6 months prior to receiving a first course of therapy using a biologic disease-modifying anti-rheumatic drug (DMARD)
Substantive Change:	<p>The new description is revised to read: Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have documentation of a tuberculosis (TB) screening performed and results interpreted within 12 months prior to receiving a first course of therapy using a biologic disease-modifying anti-rheumatic drug (DMARD).</p> <p>The new numerator is revised to read: Patients for whom a TB screening was performed and results interpreted within 12 months prior to receiving a first course of therapy using a biologic DMARD.</p>
Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We updated to the numerator to require the TB screening 12 months prior to the first biologic treatment rather than 6 months as currently stated. The measure steward believes this measure should be more in line with the specifications found in a similar measure developed by the American College of Rheumatology (ACR) and endorsed by the National Quality Forum (NQF). In creating its version of this measure, the ACR conducted an extensive development and review process. The measure was built by a panel of rheumatology experts, in conjunction with the ACR, based on quality of care guidelines and broad reviews of relevant research. Upon completion, the measure was shared with thousands of rheumatology clinicians across the U.S. for public comment. Following the comment period, the measure was updated appropriately based on the feedback received, then rigorously tested to ensure reliability and validity. The measure, along with the results of the testing, was submitted to the NQF for review and obtained trial endorsement. We typically prefer the use of NQF endorsed measures over measures that lack endorsement. However, NQF endorsement is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus. We believe this measure revision from tuberculosis screening from 6 months to 12 months can be supported by evidence and is an important measure to ensure proper tuberculosis screening for rheumatoid arthritis patients.</p>
We did not receive specific comments regarding these measure changes.	
FINAL ACTION: We are finalizing the changes to measure Q176 as proposed for the 2019 Performance Period and future years.	

D.7. Rheumatoid Arthritis (RA): Periodic Assessment of Disease Activity

Category	Description
NQF #:	N/A
Quality #:	177
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have an assessment and classification of disease activity within 12 months.
Substantive Change:	<p>The new numerator is revised to read: Patients with disease activity assessed by an ACR-endorsed rheumatoid arthritis disease activity measurement tool classified into one of the following categories: remission, low, moderate or high, at least ≥ 50 percent of total number of outpatient RA encounters in the measurement year.</p> <p>The new definition is revised to read: Assessment and Classification of Disease Activity – Assesses if physicians are utilizing a standardized, systematic approach for evaluating the level of disease activity for each patient at least for ≥ 50 percent of total number of outpatient RA encounters. The scales/instruments listed are the ACR-endorsed tools that should be used to define activity level and cut-off points:</p> <ul style="list-style-type: none"> -Clinical Disease Activity Index (CDAI) -Disease Activity Score with 28-joint counts (erythrocyte sedimentation rate or C-reactive protein) (DAS-28) -Patient Activity Scale (PAS) -Patient Activity Score-II (PAS-II) -Routine Assessment of Patient Index Data with 3 measures (RAPID 3) -Simplified Disease Activity Index (SDAI) <p>A result of any kind qualifies for meeting numerator performance.</p>
Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We updated the numerator to change the requirement to assess disease activity from once a year to "≥ 50 percent of encounters in the measurement year" and to change the use of any standardized tool to only use ACR-endorsed tools. Currently, the measure is only required to be submitted once per performance period. The current measure identifies tools that are available, but allows eligible clinicians to utilize tools not listed within the specification.</p> <p>The changes add a considerable degree of specificity to quality measure 177 by (1) limiting options for disease activity measures to those that have been found to be valid through a rigorous ACR process, and (2) changing the frequency of assessment to include a majority of clinical encounters for RA, since this approach would be consistent with current guidelines regarding treating to a pre-specified target.</p> <p>The ACR developed recommendations for the use of RA disease activity measures in clinical practice. And after thorough evaluation of around 63 available measures, ACR recommends the following 6 measures: CDAI, DAS28 (ESR or CRP), PAS, PAS-II, RAPID-3, and SDAI as ACR-endorsed RA disease activity measures to be used in clinical practice. Many of these tools are available free of charge. The tools were selected to ensure a comprehensive and standardized approach to assess disease activity for rheumatoid arthritis.</p> <p>Given this evidence, the measure steward believes this measure should be updated to be more in line with the specifications found in similar measures developed by ACR and endorsed by NQF. We agree with the revision to promote utilization of the most current guidelines that have been developed by the panel of rheumatology experts. We typically prefer the use of NQF endorsed measures over measures that lack endorsement. Disease activity assessment is imperative to development of an appropriate treatment plan. Revising the numerator to require a more frequent assessment supports development of a more effective treatment plan. We support the use of standardized tools to assess disease activity so the score can be standardized and comparable among eligible clinicians.</p>
<p>Comment: One commenter supported the revisions to measure Q177: Rheumatoid Arthritis (RA) Periodic Assessment of Disease Activity as the changes would limit the measurement tools available to clinicians for assessing disease activity levels only to those that have been found to be valid through the American College of Rheumatology process. The change to increase the frequency of disease activity assessment from only once per year to "at least 50 percent or more of clinical encounters for RA" would be consistent with clinical guidelines for RA disease activity assessment and supported those changes. A narrower list of ACR-endorsed measurement tools will create measurement uniformity for clinicians, can help establish clinical consensus in how disease activity levels should be defined, and promotes consistent outcomes measurement across RA patients.</p> <p>Response: We agree this would align with the current guideline and provide standardized approach to assess rheumatoid arthritis.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q177 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to "Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have an assessment of disease activity at ≥ 50 percent of encounters for RA for each patient during the measurement year." These changes were also applied to specialty measure sets in Table Group B where this measure is included.</p>	

D.8. Optimizing Patient Exposure to Ionizing Radiation: Appropriateness: Follow-up CT Imaging for Incidentally Detected Pulmonary Nodules According to Recommended Guidelines

Category	Description
NQF #:	N/A
Quality #:	364
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of final reports for computed tomography (CT) imaging studies of the thorax for patients aged 18 years and older with documented follow-up recommendations for incidentally detected pulmonary nodules (for example, follow-up CT imaging studies needed or that no follow-up is needed) based at a minimum on nodule size AND patient risk factors.
Substantive Change:	<p>Updated the denominator: To patients 35 years and older.</p> <p>Updated denominator exclusions: Added heavy tobacco smokers</p> <p>Updated denominator exceptions: To include medical reasons.</p> <p>Updated numerator: Includes a recommended interval and modality for follow-up.</p> <p>The new description is revised to read: Percentage of final reports for CT imaging studies with a finding of an incidental pulmonary nodule for patients aged 35 years and older that contain an impression or conclusion that includes a recommended interval and modality for follow-up [(for example, type of imaging or biopsy) or for no follow-up, and source of recommendations (for example, guidelines such as Fleischner Society, American Lung Association, American College of Chest Physicians)].</p>
Steward:	American College of Radiology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We updated the measure description and denominator from 18 years and older to 35 years and older. We also updated the numerator to include a recommended interval and modality for follow-up. The revised measure assesses final reports for CT imaging studies with a finding of an incidental pulmonary nodule for patients aged 35 years and older that contain an impression or conclusion that includes a recommended interval and modality for follow-up [(for example, type of imaging or biopsy) or for no follow-up, and source of recommendations (for example, guidelines such as Fleischner Society, American Lung Association, American College of Chest Physicians)]. The current measure specification does not allow a denominator exclusion for heavy smokers. A new denominator exclusion is included for heavy tobacco smokers who qualify for lung cancer screening. Furthermore, the current denominator exception does not account for the indication of a modality. A new denominator exception for medical reasons for not including a recommended interval and modality for follow-up.</p> <p>The changes add specificity to this measure and ensure the appropriate patient population is being targeted for this measure by: (1) updating the numerator quality action to specify a recommended interval and modality for follow-up; (2) specifying additional denominator exclusions and exceptions; and (3) changing the intended patient population (to 35 years and older) as supported by an update to clinical guidelines. We agree with the revision to promote utilization of the most current guidelines. It creates a more robust measure that defines the required clinical action to the narrowed patient population. We also agree with the addition specific denominator exceptions and denominator exclusions to promote consistent data among eligible clinicians.</p>
We did not receive specific comments regarding these measure changes.	
FINAL ACTION: We are finalizing the changes to measure Q364 as proposed for the 2019 Performance Period and future years.	

D.9. Depression Remission at Twelve Months

Category	Description
NQF #:	0710
Quality #:	370
CMS eCQM ID:	CMS159v7
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	The percentage of patients 18 years of age and or older with major depression or dysthymia who reached remission 12 months (+/- 30 days) after an index visit
Substantive Change:	<p>The new description is revised to read: The percentage of adolescent patients 12 to 17 years of age and adult patients 18 years of age or older with major depression or dysthymia who reached remission 12 months (+/- 60 days) after an index event date.</p> <p>The new denominator is revised to read: Adolescent patients 12 to 17 years of age with a diagnosis of major depression or dysthymia and an initial PHQ-9 or PHQ-9M score greater than nine during the index event.</p> <p>The new numerator is revised to read: Adolescent patients aged 12 to 17 years of age who achieved remission at 12 months as demonstrated by a 12-month (+/- 60 days) PHQ-9 or PHQ-9M score of less than five.</p>
Steward:	Minnesota Community Measurement (MNCM)
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	We added adolescents to the denominator via stratification and references to the PHQ-9M, which is specific for adolescents. The patient population has been revised to include patients 12 years of age and older, when previously only included patients over the age of 18. The score to determine denominator eligibility was based on the PHQ-9 assessment, this was expanded to include the PHQ-9M to accommodate the expanded age with age appropriate assessment tools. The measure steward worked in collaboration with NCQA, who requested a consideration of incorporating adolescents into the existing depression measures. We agreed with the expansion of the denominator to include the adolescent patient population. Depression assessment is a clinically relevant and important topic to address among adolescents. We appreciated the collaboration among the stakeholders to broaden the measure.
<p>Comment: One commenter noted the benefits and challenges associated with reporting the Depression Remission at 12 Months measure. While its inclusion in MIPS provides a more comprehensive measure set from which clinicians can choose to report, the commenter noted it carries a significant data collection burden. A second commenter stated that measure Q370 has been a challenge for academic medical centers is the depression remission measure. The depression remission measure (MH-1) measures the number of patients with major depression as defined as an initial PHQ-9 score > 9 who demonstrate remission at 12 months as defined as a PHQ-9 score < 5. The requirement for PHQ-9 use for evaluating patients combined with a follow-up evaluation is problematic for many large group practices. The measure must be recorded for 248 patients, a very difficult bar for large multi-specialty group practices which refer patients for treatment and follow-up to psychiatrists if they have a PHQ-9. The measure seems to be designed for group practices that do not have this type of referral pattern. This is just one example of practice pattern differences between large academic medical groups and small and or/ rural practices. The commenter requested that the measure be removed, and that CMS determine if there may be other measures related to depression that would be more appropriate to use in the MIPS program.</p> <p>Response: We believe this measure aligns with our policy to maintain meaningful measures within the program. Mental health issues have become prevalent in the nation and we believe it is critical to maintain measures that support improvement in mental health especially since our proposal is to expand this measure to adolescents. For this reason, we believe the benefit of measuring outcomes, as well as providing a more comprehensive measure set for the eligible clinician to report outweighs the data collection burden. In response to the commenter concern regarding the workflow of a large academic medical centers, the PHQ-9 derived from the psychiatrist could be used to determine remission as long as it is documented within the medical record. This would require communication and care coordination between the referring clinician and psychiatrist.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q370 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure: The CMS eCQM ID changed from “CMS159v6” to “CMS159v7.” These changes were also applied to specialty measure sets in Table Group B where this measure is included.</p>	

D.10. Depression Utilization of the PHQ-9 Tool

Category	Description
NQF #:	0712
Quality #:	371
CMS eCQM ID:	CMS160v7
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications
Current Measure Description:	The percentage of patients age 18 and older with the diagnosis of major depression or dysthymia who have a completed PHQ-9 during each applicable 4-month period in which there was a qualifying visit.
Substantive Change:	<p>The new description is revised to read: The percentage of adolescent patients (12 to 17 years of age) and adult patients (18 years of age or older) with a diagnosis of major depression or dysthymia who have a completed PHQ-9 or PHQ-9M tool during the measurement period.</p> <p>The new denominator is revised to read: Adolescent patients (12 to 17 years of age) and adult patients (18 years of age or older) with a diagnosis of major depression or dysthymia.</p> <p>The new numerator is revised to read: Adolescent patients (12 to 17 years of age) and adult patients (18 years of age or older) included in the denominator who have at least one PHQ-9 or PHQ-9M tool administered and completed during a 4-month measurement period.</p>
Steward:	Minnesota Community Measurement (MNCM)
High Priority Measure:	No
Measure Type:	Process
Rationale:	We added adolescents to the denominator via stratification and references to the PHQ-9M for both denominator and numerator, which is specific for adolescents. The patient population has been revised to include patients 12 years of age and older, when previously only included patients over the age of 18. The measure steward worked in collaboration with NCQA, who requested a consideration of incorporating adolescents into the existing depression measures. We agreed with the expansion of the denominator to include the adolescent patient population. Depression assessment is a clinically relevant and important topic to address among adolescents. We appreciated the collaboration among the stakeholders to broaden the measure.
<p>We did not receive specific comments regarding these measure changes.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q371 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure: The CMS eCQM ID changed from “CMS160v6” to “CMS160v7.” These changes were also applied to specialty measure sets in Table Group B where this measure is included.</p>	

D.11. Melanoma Reporting

Category	Description
NQF #:	N/A
Quality #:	397
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Pathology reports for primary malignant cutaneous melanoma that include the pT category and a statement on thickness and ulceration and for pT1, mitotic rate.
Substantive Change:	The new numerator is revised to read: Pathology reports for primary malignant cutaneous melanoma that include the pT category and a statement on thickness, ulceration and mitotic rate.
Steward:	College of American Pathologists
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We updated the numerator to include mitotic rate for all pT categories. The current measure specification only requires a statement the mitotic rate for pT1. The American Joint Committee on Cancer's Melanoma Expert Panel strongly recommends that mitotic rate be assessed and recorded for all primary melanomas, although it is not used for T1 staging in the eighth edition. The mitotic rate will likely be an important parameter for inclusion in the future development of prognostic models applicable to individual patients. Although it is not included in the T1 subcategory criteria, mitotic activity in T1 melanomas also has been associated with an increased risk of sentinel lymph node metastasis. We agreed with the addition of mitotic rate assessment for all primary melanomas. This creates valuable clinical information to the eligible clinician in order to create an effective treatment plan specific to the melanoma.
We did not receive specific comments regarding these measure changes.	
FINAL ACTION: We are finalizing the changes to measure Q397 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to "Pathology reports for primary malignant cutaneous melanoma that include the pT category and a statement on thickness, ulceration and mitotic rate." These changes were also applied to specialty measure sets in Table Group B where this measure is included.	

D.12. Psoriasis: Clinical Response to Systemic Medications

Category	Description
NQF #:	N/A
Quality #:	410
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of psoriasis vulgaris patients receiving oral systemic or biologic therapy who meet minimal physician-or patient-reported disease activity levels. It is implied that establishment and maintenance of an established minimum level of disease control as measured by physician-and/or patient-reported outcomes will increase patient satisfaction with and adherence to treatment.
Substantive Change:	<p>The new description is revised to read: Percentage of psoriasis vulgaris patients receiving systemic medication who meet minimal physician-or patient- reported disease activity levels. It is implied that establishment and maintenance of an established minimum level of disease control as measured by physician-and/or patient-reported outcomes will increase patient satisfaction with and adherence to treatment</p> <p>The new denominator is revised to read: All patients with a diagnosis of psoriasis vulgaris and treated with a systemic medication.</p> <p>The new numerator is revised to read: Patients who have a documented physician global assessment (PGA; 5-point OR 6-point scale), body surface area (BSA), psoriasis area and severity index (PASI) and/or dermatology life quality index (DLQI) that meet any one of the below specified benchmarks.</p>
Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	<p>We updated the measure title, description and denominator to expand the measure to include systemic medications that are administered both orally and subcutaneously. The measure still includes biologics rather than only oral and biologic medications. The patient population includes those diagnosed with psoriasis vulgaris receiving systemic medications that are administered both orally and subcutaneously or biologic therapy who meet minimal physician-or patient- reported disease activity levels. In addition, the numerator is being expanded to include the 5-point PGA scale as an additional benchmark. The current numerator allow the use of PGA; 6-point scale), body surface area (BSA), psoriasis area and severity index (PASI) and/or dermatology life quality index (DLQI) to assess clinical response.</p> <p>The measure steward believes the update to allow all systemic medications is relevant as they have deemed them to all apply to the measure. Based on recent literature, there is a strong correlation in how the 5-point scale is used like the 6-point PGA scale, resulting in comparative results. This scale is requested to be added to allow clinicians a shorter scale to choose from which would be more user-friendly in a clinical setting. We agreed with the expansion of the denominator to include all systemic medications, not limited to oral systemic or biologic therapy. Including systemic medications administered subcutaneously provides an additional opportunity to assess effective outcomes this treatment option. We agreed with the 5-point PGA scale to allow an additional tools to assess psoriasis outcomes.</p>
<p>Comment: Several commenters supported the measure expansion for Q410: Psoriasis: Clinical Response to Systemic Medications to systemic drugs that are administered both orally and subcutaneously. Psoriasis had been an underrepresented clinical category within the MIPS measure set in recent years, and the expansion of this measure creates additional opportunities to demonstrate the effectiveness of new treatment options.</p> <p>Response: We thank the commenters for their support of measure Q410: Psoriasis: Clinical Response to Systemic Medications.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q410 as proposed for the 2019 Performance Period and future years. We are finalizing this measure as a MIPS CQMs Specification only. This measure will not be available as a Medicare Part B Claims Measure Specification as it is not analytically feasible for this collection type. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Title was changed from “Psoriasis: Clinical Response to Oral Systemic or Biologic Medications” to “Psoriasis: Clinical Response to Systemic Medications.” These changes were applied to specialty measure sets in Table Group B where this measure is included.</p>	

D.13. Depression Remission at Six Months

Category	Description
NQF #:	0711
Quality #:	411
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	The percentage of patients 18 years of age or older with major depression or dysthymia who reached remission 6 months (+/- 30 days) after an index visit.
Substantive Change:	<p>The new description is revised to read: The percentage of adolescent patients 12 to 17 years of age and adult patients 18 years of age or older with major depression or dysthymia who reached remission 6 months (+/- 60 days) after an index event date.</p> <p>The new denominator is revised to read: Submission Criteria 1: Adolescent patients 12 to 17 years of age with a diagnosis of major depression or dysthymia and an initial PHQ-9 or PHQ-9M score greater than nine during the index event. Submission Criteria 2: Adult patients 18 years of age or older with a diagnosis of major depression or dysthymia and an initial PHQ-9 or PHQ-9M score greater than nine during the index event.</p>
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	<p>We added adolescents to denominator via stratification and references to the PHQ-9M which is specific for adolescents. The patient population has been revised to include patients 12 years of age and older, when previously only included patients over the age of 18. The score to determine denominator eligibility was based on the PHQ-9 assessment, this was expanded to include the PHQ-9M to accommodate the expanded age with age appropriate assessment tools. The measure steward worked in collaboration with NCQA, who requested a consideration of incorporating adolescents into the existing depression measures. We agreed with the expansion of the denominator to include the adolescent patient population. Depression assessment is a clinically relevant and important topic to address among adolescents. We appreciated the collaboration among the stakeholders to broaden the measure.</p>
We did not receive specific comments regarding these measure changes.	
FINAL ACTION: We are finalizing the changes to measure Q411 as proposed for the 2019 Performance Period and future years.	

D.14. Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 18 Years and Older

Category	Description
NQF #:	N/A
Quality #:	415
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of emergency department visits for patients aged 18 years and older who presented within 24 hours of a minor blunt head trauma with a Glasgow Coma Scale (GCS) score of 15 and who had a head CT for trauma ordered by an emergency care provider who have an indication for a head CT
Substantive Change:	<p>Updated the measure description and denominator to remove the requirement of a patient presenting to the emergency department within 24 hours of a minor blunt head trauma, as well as remove the requirement to document a GCS of 15.</p> <p>The new description is revised to read: Percentage of emergency department visits for patients aged 18 years and older who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care clinician who have an indication for a head CT.</p> <p>The new denominator is revised to read: All emergency department visits for patients aged 18 years and older who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider</p> <p>Updated the numerator: To indicate the GCS score less than 15 is an appropriate indication for a head CT. The new definition within the numerator is revised to include a GSC score less than 15.</p>
Steward:	American College of Emergency Physicians (ACEP)
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale:	<p>We updated to the measure description and denominator to remove the requirement of a patient presenting to the emergency department within 24 hours of a minor blunt head trauma, as well as remove the requirement to document a GCS of 15. We updated the numerator to indicate the GCS score less than 15 is an appropriate indication for a head CT. The new description is revised to read: Percentage of emergency department visits for patients aged 18 years and older who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who have an indication for a head CT.</p> <p>Based on feedback from the measure steward, this measure is appropriate for all minor blunt head traumas, regardless of when they occurred in relation to presentation to the ED. Additionally, in order to better align the measure with the evidence base and guidelines supporting the measure, the measure steward determined that the GCS of <15 data element would be more accurately included as an appropriate indication for ordering a head CT, so this has been relocated to the numerator definition. We agreed with the recommendation and accept the revision as this promotes utilization of the most current guidelines to determine imaging requirements based on the documented GCS.</p>
We did not receive specific comments regarding these measure changes.	
FINAL ACTION: We are finalizing the changes to measure Q415 as proposed for the 2019 Performance Period and future years.	

D.15. Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 2 through 17 Years

Category	Description
NQF #:	N/A
Quality #:	416
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of emergency department visits for patients aged 2 through 17 years who presented within 24 hours of a minor blunt head trauma with a Glasgow Coma Scale (GCS) score of 15 and who had a head CT for trauma ordered by an emergency care provider who are classified as low risk according to the Pediatric Emergency Care Applied Research Network (PECARN) prediction rules for traumatic brain injury
Substantive Change:	<p>Updated denominator: To remove the requirement of a patient presenting to the emergency department within 24 hours of a minor blunt head trauma, as well as remove the requirement to document a GCS of 15.</p> <p>The measure description is revised to read: Percentage of emergency department visits for patients aged 2 through 17 years who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who are classified as low risk according to the Pediatric Emergency Care Applied Research Network (PECARN) prediction rules for traumatic brain injury.</p> <p>Updated the numerator: To indicate the GCS score less than 15 is an appropriate indication for a head CT.</p>
Steward:	American College of Emergency Physicians
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale:	<p>We updated the measure description and denominator to remove the requirement of a patient presenting to the emergency department within 24 hours of a minor blunt head trauma, as well as remove the requirement to document a GCS of 15. We updated the numerator to indicate the GCS score less than 15 is an appropriate indication for a head CT.</p> <p>Based on feedback from the measure steward, this measure is appropriate for all minor blunt head traumas, regardless of when they occurred in relation to presentation to the ED. Additionally, in order to better align the measure with the evidence base and guidelines supporting the measure, ACEP physician leaders determined that the GCS of <15 data element would be more accurately included as an appropriate indication for ordering a head CT, so this has been relocated to the numerator definition. We agreed with the revision as this promotes utilization of the most current guidelines to determine imaging requirement based on the documented GCS.</p>
We did not receive specific comments regarding these measure changes.	
FINAL ACTION: We are finalizing the changes to measure Q416 as proposed for the 2019 Performance Period and future years.	

D.16. Functional Status Change for Patients with Knee Impairments

Category	Description
NQF #:	0422
Quality #:	217
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report measure of change in functional status for patients 14 year+ with knee impairments. The change in functional status (FS) assessed using FOTO's (knee) PROM (patient-reported outcomes measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality
Substantive Change:	Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians. The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agreed with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for measure Q217: Functional Status Change for Patients with Knee Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted, not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing changes to measure Q217 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to "A patient-reported outcome measure of risk-adjusted change in functional status for patients aged 14 years+ with knee impairments. The change in functional status (FS) is assessed using the Knee FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey)." The Measure Type was changed from "Outcome" to "Patient Reported Outcome." These changes were applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.17. Functional Status Change for Patients with Hip Impairments

Category	Description
NQF #:	0423
Quality #:	218
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report measure of change in functional status (FS) for patients 14 years+ with hip impairments. The change in functional status (FS) assessed using FOTO's (hip) PROM (patient- reported outcomes measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality
Substantive Change:	Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians. The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agreed with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for measure Q218: Functional Status Change for Patients with Hip Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q218 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to "A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with hip impairments. The change in functional status (FS) is assessed using the Hip FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey)." The Measure Type was changed from "Outcome" to "Patient Reported Outcome." These changes were applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.18. Functional Status Change for Patients with Lower Leg, Foot or Ankle Impairments

Category	Description
NQF #:	0424
Quality #:	219
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report measure of change in functional status (FS) for patients 14 years+ with foot and ankle impairments. The change in functional status (FS) assessed using FOTO's (foot and ankle) PROM (patient reported outcomes measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality
Substantive Change:	Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians. The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agree with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for the Q219: Functional Status Change for Patients with Foot or Ankle Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q219 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Title was changed from "Functional Status Change for Patients with Foot or Ankle Impairments" to "Functional Status Change for Patients with Lower Leg, Foot or Ankle Impairments". The Measure Description was updated to "A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with foot, ankle and lower leg impairments. The change in functional status (FS) assessed using the Foot/Ankle FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey)." The Measure Type was changed from "Outcome" to "Patient Reported Outcome." These changes were also applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.19. Functional Status Change for Patients with Low Back Impairments

Category	Description
NQF #:	0425
Quality #:	220
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report outcome measure of change in functional status for patients 14 years+ with lumbar impairments. The change in functional status (FS) assessed using FOTO (lumbar) PROM (patient reported outcome measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level by to assess quality
Substantive Change:	Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians. The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agreed with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for the Q220: Functional Status Change for Patients with Lumbar Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q220 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Title was changed from “Functional Status Change for Patients with Lumbar Impairments” to “Functional Status Change for Patients with Low Back Impairments”. The Measure Description was updated to “A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with low back impairments. The change in functional status (FS) is assessed using the Low Back FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level by to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey).” The Measure Type was changed from “Outcome” to “Patient Reported Outcome.” These changes were also applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.20. Functional Status Change for Patients with Shoulder Impairments

Category	Description
NQF #:	0426
Quality #:	221
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report outcome measure of change in functional status (FS) for patients 14 years+ with shoulder impairments. The change in functional status (FS) assessed using FOTO's (shoulder) PROM (patient reported outcomes measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality
Substantive Change:	<p>The new description is revised to read: A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with shoulder impairments. The change in functional status (FS) is assessed using the Shoulder FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.).The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey).</p> <p>Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians.</p> <p>The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.</p>
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agreed with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for measure Q221: Functional Status Change for Patients with Shoulder Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q221 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to "A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with shoulder impairments. The change in functional status (FS) is assessed using the Shoulder FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.).The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey)." The Measure Type was updated from "Outcome" to "Patient Reported Outcome". These changes were also applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.21. Functional Status Change for Patients with Elbow, Wrist or Hand Impairments

Category	Description
NQF #:	0427
Quality #:	222
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report outcome measure of functional status (FS) for patients 14 years+ with elbow, wrist or hand impairments. The change in FS assessed using FOTO (elbow, wrist and hand) PROM (patient reported outcomes measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality
Substantive Change:	Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians. The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agreed with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for measure Q222: Functional Status Change for Patients with Elbow, Wrist or Hand Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q222 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to “A patient-reported outcome measure of risk-adjusted change in functional status (FS) for patients 14 years+ with elbow, wrist or hand impairments. The change in FS is assessed using the Elbow/Wrist/Hand FS patient-reported outcome measure (PROM) (©Focus on Therapeutic Outcomes, Inc.) The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey).” The Measure Type was updated from “Outcome” to “Patient Reported Outcome”. These changes were also applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.22. Functional Status Change for Patients with General Orthopedic Impairments

Category	Description
NQF #:	0428
Quality #:	223
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A self-report outcome measure of functional status (FS) for patients 14 years+ with general orthopedic impairments (neck, cranium, mandible, thoracic spine, ribs or other general orthopedic impairment). The change in FS assessed using FOTO (general orthopedic) PROM (patient reported outcomes measure) is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level by to assess quality
Substantive Change:	Updated the denominator to allow coding for chiropractors and outpatient eligible clinicians. The new denominator is revised to expand to: Physician Denominator Criteria and Chiropractic Care Denominator Criteria.
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We expanded the denominator to allow coding for chiropractors and outpatient eligible clinicians. The current measure only includes coding to support physical and occupational therapists. The measure steward has recommended expanding the denominator to include other types of eligible clinicians providing outpatient and chiropractic services. Physical functional status is relevant to a broad spectrum of specialties in order to assess the effectiveness of a treatment plan. We agreed with the recommendation and are proposing the expansion as it allows a broader spectrum of eligible clinicians the opportunity to submit outcome measures.
<p>Comment: Two commenters supported the substantive change proposed for measure Q223: Functional Status Change for Patients with Other General Orthopedic Impairments measure by allowing coding for chiropractic clinicians but emphasized that unless chiropractors are reimbursed for CPT code 98943 which covers extraspinal, one or more regions (currently NOT covered by Medicare), the current three codes will not apply to this measure.</p> <p>Response: This measure can only be submitted utilizing the MIPS CQMs Specifications, which allows all payer data to be submitted not just Medicare. Therefore, chiropractors utilizing CPT code 98943 can include those patients in the denominator for this measure. Specific Medicare reimbursement for this code would not preclude the eligible clinician from submitting this measure.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q223 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: The Measure Description was updated to “A patient-reported outcome measure of risk-adjusted change in functional status (FS) for patients aged 14 years+ with general orthopedic impairments (neck, cranium, mandible, thoracic spine, ribs or other general orthopedic impairment). The change in FS is assessed using the General Orthopedic FS PROM (patient reported outcome measure) (©Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static survey).” The Measure Type was updated from “Outcome” to “Patient Reported Outcome”. These changes were also applied to specialty measure sets in Table Group B where this measure is included. (Please note that these technical changes were erroneously characterized as substantive changes in the proposed rule.)</p>	

D.23. Overuse of Imaging for the Evaluation of Primary Headache

Category	Description
NQF #:	N/A
Quality #:	419
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients with a diagnosis of primary headache disorder whom advanced brain imaging was not ordered
Substantive Change:	<p>Updated the measure analytics to be an inverse measure and remove the assessment of the appropriate use for Computed Tomography Angiography (CTA) and Magnetic Resonance Angiography (MRA).</p> <p>The new description is revised to read: Percentage of patients for whom imaging of the head (CT or MRI) is obtained for the evaluation of primary headache when clinical indications are not present</p> <p>The new numerator is revised to: Patients for whom imaging of the head (Computed Tomography (CT) or Magnetic Resonance Imaging (MRI)) is obtained for the evaluation of primary headache when clinical indications are not present.</p>
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We adjusted the measure analytics to produce inverse performance data and update the numerator to reflect new clinical evidence regarding the diagnostic imaging modalities (removing CTA and MRA). Updating inverse measure analytics for this measure will appropriately represent the data produced by an overuse measure. The measure development workgroup, procured by AAN, reviewed available evidence and found that there are different indications for imaging with CTA and MRA compared to CT and MRI. The indications for clinical management of primary headache, (which are listed in the measure) are only appropriate for CT and MRI. The updated clinical guidelines included in the measure support this as well.
<p>Comment: One commenter supported changes to measure Q419: Overuse Of Imaging For Patients With Primary Headache so that it would focus only on CT and MRI scans ordered (omitting CTA and MRA imaging to create consistency with the indication for clinical management of primary headache), and will also capture inverse performance data. However, the commenter underscored that unmet needs continue to exist related to quality measures for migraine and primary headache disorder, and that CMS is missing an opportunity to consider the costly impact of medication overuse that can result from inadequate response to existing treatments for migraine and primary headache disorder. The commenter requested that CMS, along with the MAP, NQF, and other stakeholders consider new and/or existing measures that addresses the rate of acute medication overuse among patients suffering from migraine. The Institute for Clinical Systems Improvement (ICSI) has developed the measure, “Percentage of patients with migraine headache with a prescription for opiates or barbiturates for the treatment of migraine” to address overuse of opioids and narcotics for the treatment of migraine headache.</p> <p>Response: We encourage the commenter to collaborate with measure developers to submit measures to the Call for Measures process that have been fully tested and address migraine and headache disorder.</p> <p>FINAL ACTION: We are finalizing the changes to measure Q419 as proposed for the 2019 Performance Period and future years. Please note that the following technical changes were also made to this measure for further accuracy based on feedback from the measure steward: Measure Title was updated from “Overuse of Imaging For Patients With Primary Headache” to “Overuse of Imaging for the Evaluation of Primary Headache”. Measure Type was updated from “Efficiency” to “Process”. These changes were also applied to specialty measure sets in Table Group B where this measure is included.</p>	

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Q005: Heart Failure: Angiotensin-Converting Enzyme Inhibitor (ACEI) or Angiotensin Receptor Blocker (ARB) Therapy for Left Ventricular Systolic Dysfunction

Specialty Sets: Cardiology, Family Medicine, Internal Medicine

Comment: One commenter supported measure Q005: Heart Failure: Angiotensin-Converting Enzyme Inhibitor (ACEI) or Angiotensin Receptor Blocker (ARB) Therapy for Left Ventricular Systolic Dysfunction because there is good evidence that ACE inhibitors and ARBs improve the health of people with heart failure and LVEF < 40%, and the measure aligns with current guidelines and represents high-value care for patients with chronic heart failure.

Response: We thank the commenter for the support of measure Q005: Heart Failure: Angiotensin-Converting Enzyme Inhibitor (ACEI) or Angiotensin Receptor Blocker (ARB) Therapy for Left Ventricular Systolic Dysfunction.

Q006: Coronary Artery Disease: Antiplatelet Therapy

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

Comment: One commenter supported measure Q006: Coronary Artery Disease: Antiplatelet Therapy. The evidence base would benefit from re-evaluation as data surfaces on the benefits and risks of aspirin therapy in patients who are already prescribed warfarin therapy as supported by several societies. It may also be difficult for clinicians to capture over the counter aspirin use unless explicitly stated by the patient.

Response: We do not see the over the counter aspirin use to be a major impact to performance. In addition, medication lists should include all known prescriptions, over-the counters, herbals, and vitamin/mineral/dietary (nutritional) supplements with the medications' name, dosages, frequency and route of administration.

Q007: Coronary Artery Disease: Beta-Blocker Therapy--Prior Myocardial Infarction or Left Ventricular Systolic Dysfunction (LVEF < 40%)

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

Comment: One commenter supported measure Q007: Coronary Artery Disease: Beta-Blocker Therapy--Prior Myocardial Infarction or Left Ventricular Systolic Dysfunction (LVEF < 40%). However, the commenter cited that skepticism exists surrounding consistency across operating systems to include all billing codes for appropriate exclusion criteria. Furthermore, while the measure is based on clinical recommendations of a number of societies, there is some question surrounding the need for continued beta-blocker therapy for 3 years in low-risk patients in the contemporary era of revascularization. Lastly, it is unnecessarily burdensome for clinicians to look at all LVEF assessments in a complete patient history, and developers should consider revising the specifications to limit the look-back window and exclude patients with a normal LVEF without history of LVSD.

Response: The measure is based on the ACCF/AHA/ACP/AATS/PCNA/SCAI/STS guidelines and we will continue to monitor and collaborate with the measure steward if updated guidelines are published. We disagree that inconsistent billing coding would not allow appropriate exclusion submission. As an eCQM, it has been fully tested to appropriately identify exclusions within an EHR. As a MIPS CQMs, data is not limited to billing coding to determine exclusions. Documentation of prior LVEF <40% is required to determine denominator eligibility is supported by clinical guidelines. Beta-blockers have been shown to reduce risk of death are recommended indefinitely for patients with CAD and LV systolic dysfunction.

Q008: Heart Failure: Beta-blocker therapy for Left Ventricular Systolic Dysfunction

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

Comment: One commenter supported measure Q008: Heart Failure: Beta-blocker therapy for Left Ventricular Systolic Dysfunction because the balance of evidence shows that long-term treatment with beta-blockers can lessen the symptoms of heart failure, improve the clinical status of patients, and enhance the patient's overall sense of well-being. The measure aligns with current guidelines and represents high-value care for patients with chronic heart failure.

Response: We thank the commenter for the support of measure Q008: Heart Failure: Beta-blocker therapy for Left Ventricular Systolic Dysfunction.

Q009: Antidepressant Medication Management

Specialty Sets: Family Medicine, Internal Medicine, Mental/Behavioral Health

Comment: One commenter did not support measure Q009: Antidepressant Medication Management. Reasons cited included: the time frame used in the measure contradicts recommendations from evidence-based guidelines; measure specifications do not consider alternative interventions for depression management such as psychotherapy, electroconvulsive therapy (ECT), or the combination of somatic and psychotherapy; the measure excludes patient choice to switch to another modality of effective therapy due to side effects (where measure specifications should include exclusion criteria for lack of patient adherence due to the side effects of medication with documentation of alternative therapy); the requirement for acute phase treatment should be deleted; and the measure intends to evaluate quality outcomes at the health plan level, but the measure as included in MIPS intends to assess performance at the individual clinician level where clinicians are unaware of information (for example, medication refill data) related to effective management of medication adherence.

Response: We consulted with the measure steward and they will take your suggestions regarding adjustment of timeframes, alternative interventions, inclusion of patient choice, and assessing outcome evaluation levels under consideration for future updates to this measure.

Q039: Screening for Osteoporosis for Women 65-85 Years of Age

Specialty Sets: Family Medicine, Internal Medicine, Preventive Medicine, Rheumatology, Geriatrics

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Comment: One commenter supported measure Q039: Screening for Osteoporosis for Women 65-85 Years of Age. The commenter noted that implementation could promote overuse of screening if patients receive care from multiple clinicians and/or have poor record continuity, and in women who are at lower risk for osteoporosis based on reasonably identifiable factors (for example, BMI, ethnicity). The commenter suggested that developers should consider updating the denominator specifications to include exclusion criteria for patients who have already been assessed with the FRAX tool and for patients receiving hospice and palliative care where the intervention

Response: We do not agree that it would promote overuse of screening as it requires documentation of one historical screening. Eligible clinicians are expected to coordinate their care with eligible clinicians. We will provide feedback to the measure steward to include the FRAX tool exclusion to be fully vetted through the annual revision process. In response to the commenter's request to include a hospice exclusion, this is included within the measure specification.

Q046: Medication Reconciliation Post-Discharge

Specialty Sets: Orthopedic Surgery, Nephrology, General Surgery, Geriatrics

Comment: One commenter did not support measure Q046: Medication Reconciliation Post-Discharge although it can help to eliminate medication errors that may occur during transitions of care and will not promote over- or underuse and timely reconciliation of discharge medication lists. The commenter expressed the following concerns: 2013 PQRS participation results do not necessarily represent performance on a national level; the measure has insufficient evidence to support this as an accountability measure and it is a "check the box measure;" a more standardized approach is needed for medication adherence, the numerator specifications exclude clinicians who are capable of reconciling medication lists which could limit the success of this measure from a health plan/integrated delivery system perspective; and clinicians may encounter interoperability barriers to data access.

Response: This measure promotes appropriate medication management, communication and care coordination between caregivers. Although the impact of medication reconciliation alone on patient outcomes is not well studied, there is expert agreement that potential benefits outweigh the harm. We applaud the clinicians that adhere to this practice, but believe this concept improves communication and patient safety. This is considered a process measure and we are looking to move towards outcome-based measures. In addition, we encourage the commenter to work with measures' developers to submit new measures through the Call for Measures process. We disagree with the commenter citing barriers based on clinicians utilizing different EHRs. The measure stewards allow multiple methods of medication reconciliation as defined in the numerator. The measure steward has standardized the clinicians that are able to complete the quality action. A prescribing practitioner, clinical pharmacists or registered nurse should conduct medication reconciliation. We will provide your recommendation to the measure steward to include pharmacy technicians in future iterations of the measure specification.

Q047: Advance Care Plan

Specialty Sets: Cardiology, Gastroenterology, Family Medicine, Internal Medicine, Obstetrics/Gynecology, Orthopedic Surgery, Otolaryngology, Physical Medicine, Preventive Medicine, Neurology, Nephrology, General Surgery, Vascular Surgery, Thoracic Surgery
Urology, Oncology, Rheumatology, Geriatrics, Skilled Nursing Facility

Comment: One commenter did not support measure Q047: Advance Care Plan, and cited it could prevent overuse of unnecessary end of life care interventions. The commenter noted the measure is burdensome for clinicians to annually document an advance care plan for all patients aged 65 years and older and also objects to the 12-month measurement period included in the denominator specifications. There is no evidence to guide optimal frequency and at what age to begin planning, and it may be inappropriate for clinicians to perform this intervention during an initial office visit. Lastly, the denominator population could be revised to established patient visits only.

Response: We disagree with concern this measure may be burdensome to document an advance care plan annually. The eligible clinician is not required to create a new advance care plan but confirms annually that the plan in the medical record is still appropriate or starts a new discussion. We will provide your suggestion to the measure steward regarding the narrowing of the patient population to established patient only. The measure steward does state the measure is appropriate for use in all healthcare settings (for example, inpatient, nursing home, and ambulatory) except the emergency department. For each of these settings, there should be documentation in the medical record(s) that advance care planning was at least discussed or documented. Eligible clinicians are still able to be numerator compliant if the advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan. We maintain the notion that Q047 is a good measure that promotes initiation of communication. With the inclusion of new patient visit coding, this would likely affect all eligible clinicians submitting the measure, therefore data would be comparable.

Q050: Urinary Incontinence: Plan of care for Urinary Incontinence in Women Aged 65 Years and Older

Specialty Sets: Family Medicine, Internal Medicine, Obstetrics/Gynecology, Urology, Geriatrics

Comment: One commenter supported measure Q050: Urinary Incontinence: Plan of care for Urinary Incontinence in Women Aged 65 Years and Older because a performance gap exists, treatments exist to create meaningful improvements in clinical outcomes/quality of life and the benefits of reducing the patient disease burden outweigh the clinician measurement burden. Although, they stated that developers cite weak evidence to support the benefit of care plan development on clinical outcomes in women with urinary incontinence. Additionally, developers should consider updating denominator specifications to include exclusion criteria for patients who refuse care plan services. Lastly, this measure is meant for the system level and individual clinicians may encounter interoperability barriers retrieving this data.

Response: There is some high quality evidence for use pelvic floor muscle training in the treatment of older women with UI and pharmacologic treatment if training is unsuccessful. In response to the request to add a denominator exception for patient refusal of a care plan, the measure steward does not allow patient refusals for this measure. We understand the commenter's concern; however, all eligible clinicians submitting measure Q050, regardless of data method, will not have the ability to submit a patient refusal and therefore are comparable when calculating the performance of the measure.

Q107: Adult Major Depressive Disorder: Suicide Risk Assessment

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Specialty Sets: Family Medicine, Emergency Medicine, Mental/Behavioral Health

Comment: One commenter supported measure Q107: Adult Major Depressive Disorder: Suicide Risk Assessment but noted several recommendations that could improve the measure quality. These included: the measure is close to being topped out and developers should include current, national performance data in the updated measure report; the numerator is not clearly specified, such as what constitutes a “recurrent” episode because as currently stated, the measure could apply to all follow-up visits with the mention of even well-controlled depression; this is a “check the box measure” with little potential to shift quality; and the measure poses significant burden.

Response: We will work with the measure developer to provide additional context in future years. We suggest the commenter to review the full measure specification for guidance on defining a recurrent episode. It clarifies an episode of major depressive disorder (MDD) would be considered to be recurrent if a patient has not had an MDD-related encounter in the past 105 days. If there is a gap of 105 or more days between visits for major depressive disorder (MDD) that would imply a recurrent episode. The 105-day look-back period is an operational provision and not a clinical recommendation, or definition of relapse, remission, or recurrence.

Q109: Osteoarthritis: Function and Pain Assessment

Specialty Sets: Family Medicine, Orthopedic Surgery, Physical Medicine

Comment: One commenter did not support measure Q109: Osteoarthritis: Function and Pain Assessment, citing insufficient evidence to support an appropriate assessment time interval and the denominator specifications are unclear. The measure should specify utilization of a validated, standardized assessment tool that demonstrates improvements in quality outcomes. It is burdensome for clinicians to perform this assessment at every visit where OA is not the primary patient complaint. The commenter stated this measure is not an appropriate accountability measure for general internists. Additionally, clinicians may encounter interoperability barriers to data access and embedding data into the information system.

Response: It is important to remember that absence of hard evidence supporting function and pain assessment is not evidence that it is not effective. It allows eligible clinicians to adjust their treatment plans at the patient level. In response to the request to specify the validated tools, we direct the commenters to review the measure specification as it provides an extensive list of assessment tools. The submission frequency has been updated for the 2019 performance period to once per performance period. This measure is not required and encourage eligible clinicians to select quality measures that are applicable to their specialty.

Q110: Preventive Care and Screening: Influenza Immunization

Specialty Sets: Family Medicine, Internal Medicine, Obstetrics/Gynecology, Otolaryngology, Pediatrics, Preventive Medicine, Nephrology, Oncology, Infectious Disease, Rheumatology, Geriatrics, Skilled Nursing Facility

Comment: One commenter supported measure Q110: Preventive Care and Screening: Influenza Immunization because the measure aligns with current CDC Advisory Committee recommendations. However, the commenter noted that electronic health record (EHR) information blocking could prevent the transmission of immunization information between competing electronic systems.

Response: We continue to align with the Centers for Disease Control and Prevention recommendations for routine annual influenza vaccinations for all persons aged greater than or equal to 6 months. We continue to promote interoperability through Certified Electronic Health Record technology and the prevention of Information blocking. We encourage the reporting of immunizations to the appropriate Registries through Promoting Interoperability performance category and Registry reporting measures.

Comment: One commenter supported having measure Q110: Preventive Care and Screening: Influenza Immunization available in multiple specialty sets.

Response: We thank the commenter for their support of this measure.

Q111: Pneumococcal Vaccination Status for Older Adults

Specialty Sets: Family Medicine, Internal Medicine, Obstetrics/Gynecology, Otolaryngology, Nephrology, Oncology, Infectious Disease, Rheumatology, Geriatrics

Comment: One commenter did not support measure Q111: Pneumococcal Vaccination Status for Older Adults. While this measure represents an important clinical concept, implementation could promote treatment overuse if patients seek medical care from multiple clinicians and/or have poor medical record continuity. In addition, the developer should update the numerator specifications to align with current clinical recommendations on pneumococcal vaccination.

Response: The Centers for Disease Control and Prevention continues to recommend the pneumococcal vaccine in adults 65 years and older due to the high incidence of pneumococcal-related deaths and costs associated with this condition. We recommend attempts to locate missing records in a reasonable timeframe so that the initial vaccine not be postponed. We will provide the numerator language feedback to the measure steward. There is a numerator note included within the specification to provide submission guidance. We are exploring options to replace this measure in future performance periods that more closely aligns with the guidelines. However, until this measure can be replaced with a measure promoting pneumococcal vaccination, we believe this measure still promotes pneumococcal vaccination and addresses an important population health matter. As stated within the measure specification: The measure allows administration or documentation of PCV13 or PPSV23 vaccine (or both) to be numerator compliant. According to ACIP recommendations, patients should receive both vaccines. The order and timing of the vaccinations depends on certain patient characteristics, and are described in more detail in the ACIP recommendations.

Comment: One commenter supported having measure Q111: Pneumococcal Vaccination Status for Older Adults available in multiple specialty sets.

Response: We thank the commenter for their support of this measure.

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Q112: Breast Cancer Screening

Specialty Sets: Family Medicine, Obstetrics/Gynecology, Preventive Medicine

Comment: One commenter supported measure Q112: Breast Cancer Screening due to current evidence and that most health systems that have networks in place to address this issue. However, the commenter expressed concern that this measure could promote screening overuse and that a stronger measure may include exclusion criteria for system and patient related issues (for example, availability of mammography screening tools, patient preference, and limited life expectancy). Also, this measure may be less impactful than other cancer screening measures (for example, MIPS 113: Colorectal Cancer Screening).

Response: The measure's intent is to promote preventive breast cancer screening, not to address the overuse of screening. If data supports an overuse of breast screening, we encourage the development of an appropriate use of breast cancer screening measure to be submitted to the annual Call for Measures. The measure steward does incorporate denominator exclusion to exclude patients with bilateral mastectomy, receiving hospice services or residing in an Institutional Special Needs Plans (SNP) or long-term care facility. The intent of the exclusion for individuals age 65 and older residing in long-term care facilities, including nursing homes, is to exclude individuals who may have limited life expectancy and increased frailty where the benefit of the process may not exceed the risks. The numerator allows for patient preference and more accessible screening methods by including screening, diagnostic, film, digital or digital breast tomosynthesis mammography to be considered numerator compliant.

Q113: Colorectal Cancer Screening

Specialty Sets: Family Medicine, Preventive Medicine

Comment: One commenter supported measure Q113: Colorectal Cancer Screening but expressed that the developer should update the measure specifications to align with current clinical recommendations on colorectal cancer screening. Specifically, numerator specifications should include the option for clinicians to document emerging cancer screening tests (for example, stool FIT-DNA, CT colonography). Additionally, measure specifications do not include appropriate exclusion criteria and could promote overuse of screening in patients where the benefits do not outweigh the risk of harms, and this risk adjustment could be addressed by measure developers. A better measure would include exclusion criteria for patients diagnosed with dementia, patients with limited life expectancy, patients with advanced comorbidities, and patient refusal.

Response: The specification defines the screening to include any of following: Fecal occult blood test (FOBT), Flexible sigmoidoscopy, Colonoscopy Computed tomography (CT) colonography, Fecal immunochemical DNA test (FIT-DNA). The measure's intent is to promote preventive colorectal cancer screening, not to address the overuse of screening. We suggest the commenter review measure Q439: Age Appropriate Screening Colonoscopy which addresses the appropriate use with consideration to the benefits and risks. The measure excludes patients with a diagnosis or past history of total colectomy or colorectal cancer, receiving hospice services, and patient aged 65 or older in Institutional Special Needs Plans or residing in long-term care. The intent of the exclusion for individuals age 65 and older residing in long-term care facilities, including nursing homes, is to exclude individuals who may have limited life expectancy and increased frailty where the benefit of the process may not exceed the risks. The measure steward does not include a patient refusal as it is the eligible clinician's responsibility to educate their patients to see the value of preventive colorectal screening. In addition, all eligible clinicians submitting measure Q113, regardless of data submission method, will not have the ability to submit a patient refusal and therefore are comparable when calculating the performance of the measure.

Q116: Avoidance of Antibiotic Treatment in Adults with Acute Bronchitis

Specialty Sets: Family Medicine, Internal Medicine, Preventive Medicine, Urgent Care

Comment: One commenter supported measure Q116: Avoidance of Antibiotic Treatment in Adults with Acute Bronchitis because implementation could lead to measurable and meaningful improvements in clinical outcomes and prevent overuse of inappropriate antibiotic therapy in patients diagnosed with acute bronchitis. However, the commenter noted the potential for clinicians to manipulate the measure through inaccurate coding of disease classification (that is, ICD10).

Response: Eligible clinicians should not change their billing or documentation to manipulate eligibility or determination of appropriate treatment. Any claims submitted to the CMS are subject to an audit, inclusive of any performance data submitted to the quality program.

Q126: Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy –Neurological Evaluation

Specialty Sets: Family Medicine, Internal Medicine, Preventive Medicine, Podiatry

Comment: One commenter did not support measure Q126: Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy –Neurological Evaluation. Issues cited included: the measure developer cites a 44 percent performance gap based on data from the 2012 PQRS reporting year which may inaccurately represent nationwide performance levels; there is insufficient evidence to support a dedicated monofilament examination or the need to repeat the exam once the patient produces negative examination results. The numerator should specify the utilization of neurological assessment tools that are equally as effective as the mono filament in diagnosing neurological deficits in diabetic patients; and there is a lack of high-quality evidence to suggest that regular, comprehensive full lower extremity neurological examinations in the primary care setting improves outcomes for asymptomatic patients. While this measure represents good clinical care, quality improvement programs should not implement this measure to assess the performance quality of individual clinicians. The commenter cited that measure specifications had appropriate exclusion criteria.

Response: We disagree with the commenter's performance data as it was based on 2012 PQRS performance data. The 2018 MIPS Benchmark Results reflect an average 58.7 percent compliance rate. This measure is consistent with the recommendation from the Diabetics Foot Disorders: A Clinical Practice Guideline. The measure does not require the test to be repeated once the patient produces a negative result. Neurological examination is required at least once within the 12 months prior to eligible encounter. This aligns with the guidelines for a normal risk profile. We encourage eligible clinicians to perform neurological examination more frequently based on the risk. In response to the lack of evidence to support primary care to evaluate footwear, this is not a required measure

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

and encourage eligible clinicians to select measures that are clinically appropriate and align with their clinical workflow.

Q127: Diabetic Foot & Ankle Care, Ulcer Prevention – Evaluation of Footwear

Specialty Sets: Podiatry

Comment: One commenter did not support measure Q127: Diabetic Foot & Ankle Care, Ulcer Prevention – Evaluation of Footwear, citing a lack of high-quality evidence on improved patient outcomes. This measure is topped with a 93 percent compliance rate although the measure may appropriately evaluate quality performance of podiatrists.

Response: We disagree with the commenter's performance data. The 2018 MIPS Benchmark Results reflect an average 55 percent performance rate. The measure is applicable to all eligible clinicians, not just podiatry that was the basis of the commenter's performance data. In response to the lack of evidence to support primary care to evaluate footwear, this is not a required measure and encourage eligible clinicians to select measures that are clinically appropriate and align with their clinical workflow.

Q130: Documentation of Current Medications in the Medical Record

Specialty Sets: Cardiology, Gastroenterology, Dermatology, Family Medicine, Internal Medicine, Obstetrics/ Gynecology, Ophthalmology, Orthopedic Surgery, Otolaryngology, Physical Medicine, Preventive Medicine, Neurology, Mental/Behavioral Health, Nephrology, General Surgery, Vascular Surgery, Thoracic Surgery, Urology, Oncology, Infectious Disease, Neurosurgical, Rheumatology, Physical Therapy/Occupational Therapy, Geriatrics, Urgent Care

Comment: One commenter did not support measure Q130: Documentation of Current Medications in the Medical Record due to lack of high-quality evidence, it is burdensome for clinicians to document complete medication lists at every patient visit, and it is a "check the box" measure. A more appropriate measure may encourage documentation of medication lists according to clinical necessity and incentivize a standardized, methodological approach to reconciliation, according to clinician practice level (for example, physician, nurse, medical assistant) that leads to improvements in the medication management process. Furthermore, practice variables can impede the physician's ability to document complete accurate medication lists.

Response: This measure promotes patient safety to avoid adverse drug events (ADE). Documentation of current medications in the medical record facilitates the process of medication review and reconciliation by the eligible clinicians, which are necessary for reducing ADEs and promoting medication safety. This is considered a process measure and we are looking to move towards outcome-based measures. In addition, the commenter suggested substantive revisions that would require a new measure to be developed. We will continue to explore opportunities to revise this measure, but we encourage the commenter to work with measures' developers to submit new measures through the Call for Measures process. The quality action requires eligible clinicians to attest to documenting, updating or reviewing a patient's current medications using all immediate resources available on the date of encounter. We would expect if eligible clinicians identify unnecessary medications, they would collaborate with their patient to make appropriate adjustments of their medications. While we move towards outcome-based measure, we maintain Q130 initiates a clinical process that would impact patient safety.

Q131: Pain Assessment and Follow-Up

Specialty Sets: Orthopedic Surgery, Physical Medicine, Urology, Rheumatology, Physical Therapy/Occupational Therapy, Geriatrics, Urgent Care

Comment: One commenter did not support measure Q131: Pain Assessment and Follow-Up due to specification flaws that included: (1) performance rates are close to 100 percent; (2) the measure distracts from measurement of change in functional status; (3) implementation of this measure could unintentionally promote overuse of opioid therapy; (4) outdated evidence is cited to form the basis of the measure; (5) specifications do not address the importance of including a functional assessment during the patient visit; (6) specifications do not exclude patients who have known diversions to opioid therapy (for example, substance abuse and alcohol abuse disorders) and this could fuel the opioid epidemic; (7) it is burdensome for clinicians to document pain assessment and follow-up plan at every visit regardless of the patient's primary complaint; (8) referral to a pain management specialist is not practical in every area of the country; and (9) the measure language around "eliminating" pain is unreasonable.

Response: We continue to move towards high priority measures which include outcome-based measures and opioid measures. The quality action does not require an opioid prescription. We disagree with the commenter's performance data, based on the 2018 MIPS Benchmark Results this measure has an average 68.2 percent (MIPS CQMs Specifications) and 87.2 percent (Medicare Part B Claims Measure Specifications) performance rate. The measure does not require a pain management specialist nor an opioid prescription. A follow-up plan may consist of planned follow-up appointment or a referral, a notification to other care clinicians as applicable OR indicate the initial treatment plan is still in effect. These plans may include pharmacologic, interventional therapies, behavioral, physical medicine and/or educational interventions. We do not agree this measure to be burdensome as the tools to assess pain may include the Numeric Rating Scale where documentation of a fraction would meet the screening requirement. We agree with the addition of functional assessment but may add burden which was a concern raised by the commenter. In response to the measure language surround "eliminating pain," we refer the commenter to the measure specification as this is not included within the measure language.

Q134: Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan

Specialty Sets: Family Medicine, Internal Medicine, Orthopedic Surgery, Pediatrics, Preventive Medicine, Neurology, Mental/Behavioral Health

Comment: One commenter did not support measure Q134: Preventive Care and Screening: Screening for Clinical Depression and Follow-Up Plan although it aligns with USPSTF recommendations on screening for clinical depression. The commenter suggested the denominator specifications exclude patients who are currently under the care of a mental health specialist for comorbid illness or severe cognitive impairment. Developers should consider revising the denominator specifications to reflect patients seen in the calendar year instead of all patients. Measure specifications do not define an appropriate screening frequency. It is not clear whether this measure applies to all patients in a clinicians' panel or only those seen during the calendar year in a face-to-face visit.

Response: In response to the concerns surrounding the denominator, the measure does not include patients within an active diagnosis of depression or has a

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

diagnosed bipolar disorder within that patient population. In addition, the measure also allows denominator exceptions for situations where the patient's functional capacity or motivation to improve may impact the accuracy of results of standardized depression assessment tools. Patients are denominator eligible when they meet the denominator criteria within the performance period. For all MIPS quality measures at this time, eligibility is not based on the eligible clinicians' panel but requires an eligible encounter within the performance period as defined by the denominator criteria which allows both face-to-face and telehealth visits.

Comment: One commenter provided extensive information on how the PREV 12 Depression Screening (Q134) using the Web Interface methodology is being operationalized in its facility. The commenter provided specific related to the PHQ scores in its decision-making. The commenter's practice has decided on 4, but a score of 3 is also accepted in the literature and could be a reasonable cutoff for the PHQ-2. As a result, the commenter asked that CMS consider revisiting how this measure is operationalized to allow the use of evidence-based cutoffs for when further documentation is required. The commenter was also concerned that the measure numerator poses a discrepancy by still requiring depression screening and review to occur in a visit setting. The commenter has adopted a care coordination program where the primary health care provider oversees a multi-disciplinary team to address complex health conditions in a non-visit modality. A Registered Nurse care coordinator may perform the depression screening, review, and arrange for follow up during a non-visit interaction performed at regular intervals. If no active concerns are present, the patient may not be seen again before the end of the measurement period for the health care provider to review the screening at an eligible visit. This results in a measure failure, despite the patient receiving quality team-based care individualized to the patient's situation. Another situation where a patient may receive quality team-based care yet result in the patient not meeting numerator conditions is at the Annual Medicare Wellness visit. Depression Screening is a component of the Medicare Annual Wellness Visit, and one of the MIPS Web Interface required metrics in addition to being used for collection methods such as the EHR collection method. However, the PREV-12 Depression Screening specifications state: The depression screening must be reviewed and addressed in the office of the health care provider filing the code, on the date of the encounter. Our Annual Wellness Visits are typically scheduled within a month of the patient's annual visit with the health care provider; therefore, the only way to meet both requirements is to have the patient complete the depression screening questionnaire twice. The commenter noted this is redundant and takes time away from other components of patient care. The commenter requested that CMS either accept the depression screening performed at the Annual Wellness Visit as meeting the PREV-12 requirements, or eliminate depression screening from the Annual Wellness Visit, or preferably simplify the numerator to allow the latest depression screening and review to occur any time during the measurement period and not tie it to a particular visit.

Response: In regards to the determination of a positive screen, whether or not a PHQ-9 (or other standardized screening tool) screening score is considered positive would be determined by the eligible professional administering and reviewing the standardized tool results. The measure steward does not define "positive" so it is at the discretion of the eligible clinician based on their knowledge of the patient to determine if the result is considered positive or negative. For the purpose of submitting PREV-12 information, the measure requires medical record documentation of positive or negative for the depression screen result per the measure steward. There are only two instances when specific documentation of positive or negative is not required. One instance is when the PHQ result is 0 in which case the result can be assumed to be negative. The other instance is when there is documentation of a depression screen using a normalized and standardized screening tool and at the same encounter there is documentation of a recommended follow up, in which case it can be assumed the result of the screen was positive. The Web Interface allows for telehealth for PREV-12, so it is not necessary to tie the review of the screening results to a specific encounter. As long as the most recent screening during the measurement period is used, the screening occurred during the measurement period, there is documentation of positive or negative, the results have been reviewed by the clinician, and if positive a recommended follow up, the measure has been met.

Based on the commenter's scenario, this workflow would not cause the eligible clinician to fail the quality action. We encourage the commenter to work with the measure subject matter experts through the Quality Payment Program Service Center to address the concerns.

Q154, Q155, and Q318

Specialty Sets:

Q154: Family Medicine, Internal Medicine, Orthopedic Surgery, Otolaryngology, , Neurology, Podiatry, Physical Medicine, Preventive Medicine

Q155: Family Medicine, Internal Medicine, Neurology, Orthopedic Surgery, Otolaryngology, Physical Medicine, Preventive Medicine, Podiatry

Q318: Orthopedic Surgery, Nephrology

Comment: One commenter did not support measures Q154, 155, and 318 (NQF measure Q0101): Falls: Screening, Risk-Assessment, and Plan of care to Prevent Future Falls as it is unclear whether they will lead to meaningful improvements in clinical outcomes. The commenter suggested that developers consider revising the denominator specifications to include only those patients who are at high-risk of falling. Clinicians should individualize the plan of care and the care plan should be less prescriptive to account for individual patient requirements. Data collection burden associated with the multiple measure components is high and data elements seem unlikely to capture how well the service was performed. The measure relies heavily on CPT-II codes which are not widely used or captured in electronic health records (EHRs). Also, developers should consider updating the specifications to reflect the most current clinical recommendations of the USPSTF. Additionally, the evidence-base for what clearly defines best practice is complex. Lastly, while the numerator is clearly defined, it is complicated with variable validity and the components of the risk assessment model are not clearly defined.

Response: Please note these measures were being proposed for removal from the MIPS program in 2019 and we proposed a new combined Falls measure (Q477 based on specifications in NQF 0101) that will include strata components for Future Falls Risk, Falls Risk Assessment, and Falls Risk Plan of Care. As discussed already, the proposed new Q477 Falls: Screening, Risk-Assessment, and Plan of Care to Prevent Future Falls measure will not be finalized for inclusion as the measure steward believes it is not implementable at this time. Therefore, these three measures will remain in the program for the 2019 performance period as it is important to evaluate for high-risk of falling. We appreciate the feedback regarding these measures and encourage the commenter to discuss their suggestions with the measure steward for their consideration in updates for these measures. A comprehensive falls assessment is multifactorial and should be performed by a health care professional with appropriate skills and experience.

Q180: Rheumatoid Arthritis: Glucocorticoid Management

Specialty Sets: Orthopedic Surgery, Rheumatology

Comment: One commenter did not support measure Q180: Rheumatoid Arthritis: Glucocorticoid Management, citing that they did not receive adequate

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

information from the developer to evaluate the validity of this measure. The commenter noted the numerator and the denominator are poorly specified. The measure specifications do not include appropriate exclusions for patients prescribed prednisone therapy for a symptomatic flare. A cleaner measure may specify “patients with rheumatoid arthritis who are on glucocorticoids” in the denominator statement. Additionally, clinical guidelines demonstrate the importance of assessing glucocorticoid use, but only in patients who have specifically been prescribed glucocorticoid therapy.

Response: We will work with the measure steward to consider the suggested denominator exception. Limiting the denominator to those patients with RA who are on a glucocorticoid would limit the clinician’s ability to report on the measure and may not capture those RA patients who are started on a glucocorticoid during the performance period.

Q181: Elder Maltreatment Screen and Follow-Up

Specialty Sets: Family Medicine, Internal Medicine, Neurology, Mental/Behavioral Health, Geriatrics, Skilled Nursing Facility

Comment: One commenter did not support measure Q181: Elder Maltreatment Screen and Follow-Up, citing that implementation could promote overuse of unnecessary, elder services referrals and potentially fracture relationships between clinicians and their patients. The commenter stated the measure does not align with USPSTF recommendations on abuse of elderly and vulnerable adults. The commenter also stated that developers should consider revising the numerator specifications to clearly define “high risk” as some way other than age (for example, cognitive impairment, functional impairment). Moreover, the numerator details specify an overly prescriptive screening process. It may be clinically inappropriate to screen all patients over the age of 65 for elder abuse. Developers should consider revising the measure to specifically encourage screening in patients who are dependent on a caregiver or who are otherwise at risk for abuse. It is unnecessarily burdensome for physicians to document maltreatment screening for all patients aged 65 years and older at every visit. Finally, the measure requires clinicians to assess for maltreatment using a screening tool even when abuse may be readily apparent.

Response: Though the USPSTF does not support elder maltreatment screening, we respectfully disagree. It is important to remember that absence of hard evidence supporting screening is not evidence that it is not effective. There have been many qualitative reports that do support the benefits of screening. Expert consensus and public policy for mandatory reporting support the value of screening this vulnerable population. It is unclear how a definition of high risk would benefit the numerator. Limiting the denominator to patients who are dependent on a caregiver or who are otherwise at risk for abuse would be subjective and may not identify all instances of elder maltreatment. This measure advocates for a vulnerable patient population and do not agree that limiting the measure to a high-risk patient population would be appropriate. The measure does not limit to high risk patients but requires elder maltreatment screening for all patients over the age of 65 years.

Q205: HIV/AIDS: Sexually Transmitted Diseases – Screening for Chlamydia, Gonorrhea, and Syphilis

Specialty Sets: Pediatrics, Infectious Disease

Comment: One commenter did not support measure Q205: HIV/AIDS: Sexually Transmitted Diseases – Screening for Chlamydia, Gonorrhea, and Syphilis even though developers cite a significant performance gap based on data from the 2011 PQRS reporting year and that implementation will likely lead to meaningful improvements in clinical outcomes. The measure does align with the USPSTF and CDC recommendations on the prevention and treatment of opportunistic infections in HIV-infected adults, yet the commenter stated the implementation of the measure could promote overuse of screening in asymptomatic patients and in situations where clinicians encounter interoperability barriers to data retrieval. While specifications include an evidence-based time interval, they are flawed in a number of respects. The numerator and denominator envision one test since HIV diagnosis, although new infections and reinfections may occur repeatedly; gonorrhea screening may encompass several loci of infection, which should be listed; and the measure does not include an appropriate exclusion for patients who are not sexually active or otherwise unlikely to become infected. Also, the numerator specifies an indefinite look-back window. Developers should consider revising the specifications to include an evidence-based look-back window.

Response: We disagree this measure will lead to screening overuse. The denominator is limited to a high-risk patient population and we promote interoperability and is the responsibility of the care team to provide care coordination. We do agree that the subsequent screening may be appropriate to detect new or recurrent infections. We will provide this suggestion to the measure steward for possible inclusion during the annual revision cycle. In response to the request for appropriate exclusion for patients who are not sexually active or otherwise unlikely to become infected, the measure does allow for patient refusal as a denominator exception. While we agree with the suggestion to add subsequent screening for reinfection, it does not invalidate the measure. It may be more appropriate to include an annual risk assessment. The cost of screening and the variability of prevalence of these infections, decisions about routine screening for these infections should be based on epidemiologic factors (including prevalence of infection in the community or the population being served), availability of tests, and cost

Q217: Functional Status Change for Patients with Knee Impairments

Q218: Functional Status Change for Patients with Hip Impairments

Q219: Functional Status Change for Patients with Foot or Ankle Impairments

Q220: Functional Status Change for Patients with Lumbar Impairments

Q221: Functional Status Change for Patients with Shoulder Impairments

Q222: Functional Status Change for Patients with Elbow, Wrist or Hand Impairments

Q223: Functional Status Change for Patients with General Orthopedic Impairments

Specialty Sets: Physical Therapy/Occupational Therapy

Comment: One commenter stated that the issue with FOTO (Focus on Therapeutic Outcomes) measures is the measure may require payment to use the measure. Eligible clinicians may not have 100 patients in the specific joint being measured to meet the measure requirements. As a result, the clinician needs to get an exemption because he or she may not have 100 patients eligible, such as for the hip measure Q218. Also, the measure for functional outcome (general) becomes mutually exclusive to these individual FOTO measures.

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Response: As indicated within the measure specification's Copyright, the functional status measures are available in both short form (static/paper-pencil) and computer adaptive test formats, together with a scoring table and risk adjustment specifications, free of charge for the purposes of individual clinical practice, that is, patient-level measurement, including but not limited to for the purposes of participation in MIPS. We acknowledge that meeting this minimum threshold can be challenging for some eligible clinicians but for scoring purposes you would only need 20 eligible patients to meet the minimum reliability threshold for each of the measures which may be more feasible to achieve. The functional outcome (general) measure is ensuring that all visits regardless of impairment has functional outcomes assessed and although these would be covered in the functional status change measures it also measures other impairments.

Q226: Preventive Care and Screening: Tobacco use: Screening & Cessation Intervention

Specialty Sets: Cardiology, Gastroenterology, Dermatology, Family Medicine, Internal Medicine, Obstetrics/Gynecology, Ophthalmology, Orthopedic Surgery, Otolaryngology, Physical Medicine, Preventive Medicine, Neurology, Mental/Behavioral Health, General Surgery, Vascular Surgery, Thoracic Surgery, Urology, Oncology, Neurosurgical, Podiatry, Rheumatology, Urgent Care

Comment: One commenter supported measure Q226: Preventive Care and Screening: Tobacco use: Screening & Cessation Intervention because reduction of tobacco use slows the progression of respiratory disease, tobacco use is a modifiable risk factor, and the measure aligns with clinical recommendations.

Response: We thank the commenter for the support of measure Q226: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention.

Q236: Controlling High Blood Pressure

Specialty Sets: Obstetrics/Gynecology, Vascular Surgery, Thoracic Surgery, Rheumatology

Comment: One commenter did not support measure Q236: Controlling High Blood Pressure although it may result in measurable and meaningful improvements in clinical outcomes and there is a known performance gap in the area of blood pressure control. The commenter stated that the specifications for the measure under consideration for NQF-endorsement align with several societies, the MIPS measure specifications do not stratify patients into well-defined risk groups (that is, comorbid disease diagnosis) and guidelines from its own society. Furthermore, the numerator specifications define office measurements as the preferred monitoring method, while home monitoring is the preferred method to assess for adequately controlled BP. The commenter suggested that developers update the numerator specifications to include an average of several measurement results to increase accuracy and reduce the potential for overtreatment. Finally, the measure was created to assess system-level performance and may not be an appropriate accountability measure for individual clinicians who do not have access to all BP measurement results. The commenter supported CMS adoption of this measure if approved by NQF.

Response: We agree with updating the numerator to reflect the updated blood pressure values and have been discussing the revision with the measure steward. We do not agree with taking an average blood pressure as the performance is determined by the most recent blood pressure value. It does allow for multiple blood pressure readings during an eligible visit, using the lowest systolic and the lowest diastolic reading as the most recent blood pressure reading. We agree with the measure steward to exclude home readings due to the variability and may not be an accurate representation of blood pressure measurements. In addition, performance can be determined by blood pressure taken by any clinician within the clinician office. This would include blood pressure readings from other eligible clinicians participating in the patient care (that is consultation notes). We maintain the opinion this is a good measure since the new guidelines have not been widely accepted and will allow time for eligible clinicians to adopt the updated blood pressure values. This measure also encourages management of a prevalent condition.

Comment: Several commenters indicated that for measure Q236: Controlling High Blood Pressure that it should be revised to reflect recent national consensus about appropriate blood pressure measurements. A national consensus has developed that blood pressure should vary by age and diagnosis. The MIPS measure requires a strict policy of controlling to less than 140/90 for hypertensive patients, regardless of age, and 120/80 for screening purposes. These levels are not consistent with current medical evidence or opinion such as those noted in the Eighth Joint National Committee. There should be a mechanism for removal of a measure that is no longer consistent with clinical guidelines or current practice and adding the measure back to the program when re-specified.

Response: We appreciate the recommendation to update the guidelines and agree the measure should be updated in future revision cycles. However, we maintain the opinion this is a good measure since the new guidelines have not been widely accepted and will allow time for eligible clinicians to adopt the updated blood pressure values. This measure also encourages management of a prevalent condition and is limited to patients with an existing hypertension diagnosis. Additionally, the intent of the measure is not to screen patients for hypertension.

Q238: Use of High-Risk Medications in the Elderly

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Rheumatology, Geriatrics

Comment: One commenter did not support measure Q238: Use of High-Risk Medications in the Elderly, citing that controversial criteria was used to form the basis of the measure, which is based on expert opinion as opposed to high-quality evidence. The commenter noted issues with the measure specifications as follows: the denominator may inaccurately define "elderly adults" as > 65 years of age and developers should consider increasing the denominator threshold to > 80 years of age; the denominator specifications do not stratify patients into well-defined risk groups; the measure specifies medications that are not presumed to be high risk in all elderly adults (for example, acetaminophen); and the specifications do not include exclusion criteria for patient preference. Lastly, individual clinicians may encounter interoperability barriers to patient information access.

Response: We disagree with interoperability barrier, but suggest all eligible clinician maintain a current medication list, especially for patient received high-risk medications. We will provide the commenter's recommendation to risk-stratify and increase the age criteria from 65 to 80 years of age to be vetted through a technical expert panel and possible inclusion in subsequent revision cycles. One study of the prevalence of potentially inappropriate medication use in older adults found that 40 percent of individuals 65 and older filled at least one prescription for a potentially inappropriate medication and 13 percent filled two or more (Fick et al. 2008). While some adverse drug events are not preventable, studies estimate that between 30 and 80 percent of adverse drug events in the elderly are preventable (MacKinnon and Hepler 2003). The measure is based on recommendations from the American Geriatrics Society Beers Criteria for

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Potentially Inappropriate Medication Use in Older Adults. The criteria were developed through key clinical expert consensus processes by Beers in 1997, Zahn in 2001 and an updated process by Fick in 2003, 2012 and 2015.

Q243: Cardiac Rehabilitation: Patient Referral from an Outpatient Setting

Specialty Sets: Cardiology, Family Medicine, Internal Medicine

Comment: One commenter supported measure Q243: Cardiac Rehabilitation: Patient Referral from an Outpatient Setting. However, the commenter advised developers to address the following concerns during the update process to improve the measure quality: the measure is nearly capped out; implementation of this measure could unfairly penalize clinicians who practice in rural areas and who care for medically complex patient populations, so risk or socioeconomic adjustment is advised; the measure is an inappropriate accountability measure for general internists who do not report data in the PINNACLE registry; the measure may not apply well to clinicians practicing in rural settings where patients have limited access to rehabilitative services; and patients who are faced with significant travel burdens are less likely to adhere to prescribed services.

Response: We encourage the commenters to work with measures' developers to submit new measures through the Call for Measures process that would address the appropriate diagnosis and testing of COPD as we currently do not have a benchmark established for this measure. In addition, the performance data supplied was derived from a single qualified registry. We disagree that this measure may unfairly penalize clinicians who practice in rural areas and who care for medically complex patient populations. The numerator includes denominator exceptions for both system and medical reasons for not referring to an outpatient cardiac rehabilitation program. The measure does not hold general internists inappropriately accountable for referrals, as this is not a required measure. Eligible clinicians are able to choose the measures that are clinically appropriate for their specialty.

Q268: Epilepsy: Counseling for Women of Childbearing Potential with Epilepsy

Specialty Sets: Neurology

Comment: One commenter did not support measure Q268: Epilepsy: Counseling for Women of Childbearing Potential with Epilepsy although it addresses a clinical condition that is high- impact and the measure developers cite a significant gap in care. The commenter stated that evidence cited to form the basis of the measure where the interventions could potentially result in harmful patient outcomes. Problems were cited with measure specifications. The denominator specifications should include exclusion criteria for surgically sterile women, women without a history of recent seizure, and women who are not currently prescribed pharmacotherapy; the numerator definition of counseling seems overly inclusive and not necessary in all cases. Requiring six dimensions for counseling could be overly prescriptive and developers should consider revising the specifications to allow for selection of appropriate therapy that is most relevant to individual patients (that is, change the definition to include "or" rather than "and"); Developers should consider revising the denominator specifications to include women aged 45 years and older who are of childbearing potential. The commenter stated that while the many of the specifications are flawed, the developers do include validity and reliability data in the measure.

Response: To address the comment regarding denominator exclusion, we encourage the commenter to review the 2019 measure specification as the measure steward has revised the measure to exclude menopausal or surgically sterile patients. We disagree on the exclusion for patients without a recent seizure, and women who are not currently prescribed pharmacotherapy. Impacts to fertility and pregnancy risks are not limited patients receiving pharmacologic therapy. The measure steward indicates counseling should include discussion about folic acid supplementation, contraception, and potential anti-seizure medications effect on pregnancy, safe pregnancies, and breastfeeding. While we agree this definition covers an inclusive list of counseling areas, it does allow eligible clinicians to exercise their clinical judgment if medical reasons exist for not completing counseling women of childbearing potential with epilepsy. We agree with the expansion of the denominator criteria to include women who are 45 years and older who are of childbearing potential. We have requested the measure steward to consider expanding the age criteria during the annual revision cycle of the quality measures. We still believe the measure addresses an important clinical topic; the narrow denominator does not invalidate the measure.

Q271: IBD: Preventive Care: Corticosteroid Related Iatrogenic Injury--Bone Loss Assessment

Specialty Sets: Gastroenterology

Comment: One commenter did not support measure Q271: IBD: Preventive Care: Corticosteroid Related Iatrogenic Injury--Bone Loss Assessment, citing that measure developers do not cite high-quality evidence to form the basis of the measure and using dexamethasone to assess for risk of bone loss does not necessarily prevent hip fractures in patients prescribed corticosteroid therapy for IBD. Furthermore, implementation could promote overuse of dexamethasone and underuse of corticosteroid therapy. Numerator specifications encourage clinicians to screen patients who receive 10 mg/day of prednisone for 60 days, while evidence demonstrates that hip fractures are significantly higher in patients treated with medium steroid doses (2.5-7mg/day) over a duration of time. As written, the numerator could miss patients who are at risk for fracture. Also, it is unclear whether the measure encourages clinicians to screen patients who are currently prescribed prophylactic bisphosphonate therapy for risk of bone loss, which may not be clinically necessary. Lastly, developers should consider revising the numerator specifications to include an evidence-based look-back window for review of medication history as that is less burdensome. Another commenter also expressed concerns related to the numerator of this measure reflecting the risk of bone loss associated with oral corticosteroids, at any time over the patient's life, exceeding 5 mg/day for 3 or more consecutive months.

Response: The intent of the measure is to screen patients who are at risk of fracture. This knowledge can assist eligible clinicians in creation of their treatment plan. We disagree that the measure would lead to overuse of dexamethasone. Individuals who received an assessment for bone loss during the year prior and current year are considered adequately screened. Corticosteroid use is the variable most strongly associated with osteoporosis (level A evidence). However, it is difficult to distinguish corticosteroid use from disease activity in terms of causal impact on bone density, because the two are closely linked. However, there is strong evidence that those on long-term steroids of greater than 3 months have a significant increase risk of fracture (Papaioannou A. et al. All Patients with Inflammatory Bowel Disease Should Have Bone Density Assessment: Pro. Inflammatory Bowel Diseases. 2001.7(2):158-162). In response to lowering the threshold from 10 mg/day to 2.5-7 mg/day, this would expand the denominator requiring additional screening. We will provide both of the commenter's concerns regarding dexamethasone overuse and the request to expand the denominator to the measure steward to identify the appropriate population, but based on the

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

provided response, we maintain the notion this is an appropriate measure.

Q281: Dementia: Cognitive Assessment

Specialty Sets: Neurology, Mental/Behavioral Health, Geriatrics

Comment: One commenter did not support measure Q281: Dementia: Cognitive Assessment, citing a lack of high-quality evidence on the assessment of cognitive status on clinical outcomes or assessment intervals, and it is unclear how clinicians should manage assessment results. The numerator specifications include cognition assessment tools that will not necessarily benefit clinical outcomes and adherence to a formal assessment protocol is burdensome on clinicians. A more meaningful measure may encourage assessments that are likely to lead to meaningful improvements in clinical outcomes. Furthermore, the numerator specifications include proprietary cognition assessment tools (for example, Mini-Mental State Examination) that are not readily accessible to clinicians who practice in primary care settings.

Response: The measure is supported by the Guidelines for the Management of Cognitive and Behavioral Problems in Dementia. Initial and ongoing assessments of cognition are fundamental to the proper management of patients with dementia. These assessments serve as the basis for identifying treatment goals, developing a treatment plan, monitoring the effects of treatment, and modifying treatment as appropriate. While there is not a set interval for assessment, the guidelines state that assessments and visits will be based on the severity or complexity of the patient's status. For this measure, the cognitive assessment should be completed at least once per performance period but does not penalize clinicians for additional cognitive assessments completed throughout the performance period. We thank the commenter for the suggestion create more meaningful improvements to clinical outcomes and encourage the commenter to work with measures' developers to submit new measures through the Call for Measures process. We do not agree with the concern that the numerator has proprietary cognition tools as the measure also includes non-proprietary options for eligible clinician use.

Q283: Dementia: Associated Behavioral and Psychiatric Symptoms Screening and Management

Specialty Sets: Neurology, Mental/Behavioral Health, Geriatrics

Comment: One commenter did not support measure Q283: Dementia: Associated Behavioral and Psychiatric Symptoms Screening and Management, citing a lack of high-quality evidence examining the impact of assessment on clinical outcomes or on appropriate assessment intervals, and implementation may result in overuse of pharmacologic therapy. Non-pharmacologic treatment modalities exist to manage neuropsychiatric symptoms, but implementation requires caregiver involvement. The commenter stated that numerator details do not clearly specify a structured process for documentation of neuropsychiatric symptom assessment and the measure developers do not describe any reliability or validity data in the measure report.

Response: The measure is supported by the Guidelines for the Management of Cognitive and Behavioral Problems in Dementia. Neuropsychiatric symptoms may go unrecognized and untreated by eligible clinician do not actively screen their patients with specific attention to discrete symptom domains. We disagree with the unintended consequences identified by the commenter. The measure does not promote the use of pharmacologic interventions. The Clinical Recommendation Statements within the specification state, "new trials and studies better define adverse effects, but they do not strengthen the evidence for efficacy of antipsychotic drugs in treating psychosis or agitation. Rather, they demonstrate minimal or no efficacy with strong placebo effects, as well as variations in response with trial duration. These findings strengthen the support for using nonpharmacological interventions and environmental measures to attempt to reduce psychosis and agitation prior to initiation of medications." In addition, the specification provides examples of reliable and valid instruments to document neuropsychiatric symptom assessment.

Q286: Dementia: Counseling Regarding Safety Concerns

Specialty Sets: Neurology, Mental/Behavioral Health, Geriatrics

Comment: One commenter did not support measure Q286: Dementia: Counseling Regarding Safety Concerns although it can lead to improved safety outcomes and the measure specifications are appropriate. The commenter stated there is no evidence to support the impact of this intervention on clinical outcomes, the level or intensity of counseling required to change behavior, or the interval at which this intervention should be performed. This measure is also burdensome on clinicians and there is a lack of high quality evidence to support the intervention as an accountability measure.

Response: The measure is supported by the American Psychiatric Association practice guideline for the treatment of patients with Alzheimer's disease and other dementias. Screening for safety concerns has been identified as a major unmet need of persons with dementia. Though the guidelines do not identify the impact of the intervention, it is important to remember that absence of hard evidence supporting screening is not evidence that it is not effective.

Q288: Dementia: Caregiver Education and Support for Patients with Dementia

Specialty Sets: Neurology, Mental/Behavioral Health, Geriatrics

Comment: One commenter did not support measure Q288: Dementia: Caregiver Education and Support for Patients with Dementia because it may be inappropriate for clinicians to advise caregivers on medical concerns without performing appropriate clinical assessments and there is no evidence to support the impact of this intervention on clinical outcomes, the level or intensity of counseling required to change behavior, or the interval at which this intervention should be performed. Developers do not present any validity or reliability data within the measure report. Lastly, this measure is burdensome on clinicians and there is a lack of high- quality evidence to support the intervention as an accountability measure.

Response: The measure is supported by the Optimal management of Alzheimer's disease patients: Clinical guidelines and family advice. The American Medical Association (AMA) has developed a standard Caregiver Health Self-Assessment Questionnaire to help caregivers analyze their own behavior and health risks and, with the eligible clinician's assistance, make decisions that will benefit both the caregiver and the patient. This questionnaire is available on the AMA website. Based on the results of the assessment, the eligible clinician would be required to provide education and resources based on their clinical expertise. These components have been defined within the measure specification. Though the guidelines do not define the level of counseling or impact of the

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

intervention, it is important to remember that absence of hard evidence supporting screening is not evidence that it is not effective.

Q305: Initiation and Engagement of Alcohol and Other Drug Dependence Treatment

Specialty Sets: Family Medicine, Internal Medicine, Pediatrics

Comment: One commenter did not support measure Q305: Initiation and Engagement of Alcohol and Other Drug Dependence Treatment because the specifications are flawed and the measure is not appropriately specified to evaluate performance at the level of the individual clinician. Developers should consider dividing the numerator statement to form two discrete measures: (1) initiation of alcohol and other drug dependence treatment; and (2) engagement of alcohol and other drug dependence treatment. Also, it is unclear what constitutes a “new episode of drug or alcohol dependency.” The commenter did not support including this measure in accountability programs designed to assess performance of individual clinicians. It is unclear whether individual clinicians will be able to control the outcomes of this measure, and individual clinicians will likely face interoperability challenges to data collection.

Response: We will forward the commenter’s recommendation to divide the numerator into two separate measures, but we believe the measure is appropriately specified into one measure. We refer the commenter to the measure specification for the definition of episode: The new episode of alcohol and other drug dependence should be the first episode of the measurement period that is not preceded in the 60 days prior by another episode of alcohol or other drug dependence. This measure is attributed to eligible clinicians who provide care to patients diagnosed with alcohol, opioid, or other drug abuse or dependency. It is important to intensify the monitoring for substance use during periods when the patient is at a high risk of relapsing, including during the early stages of treatment, times of transition to less intensive levels of care, and the first year after active treatment has ceased.

Q309: Cervical Cancer Screening

Specialty Sets: Family Medicine, Internal Medicine, Obstetrics/Gynecology

Comment: One commenter supported measure Q309: Cervical Cancer Screening because the current evidence supports screening in women 21-64 years of age, and this measure is based on the most recent USPSTF recommendations on cervical cancer screening.

Response: We thank the commenter for the support of measure Q309: Cervical Cancer Screening.

Q310: Chlamydia Screening in Women

Specialty Sets: Obstetrics/Gynecology, Pediatrics

Comment: One commenter supported measure Q310: Chlamydia Screening in Women because it aligns with USPSTF and CDC recommendations, is supported by evidence and denominator criteria is clearly specified.

Response: We will continue to align with USPSTF and CDC recommendations on Chlamydia screening.

Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented

Specialty Sets: Cardiology, Gastroenterology, Dermatology, Family Medicine, Internal Medicine, Emergency Medicine, Obstetrics/Gynecology, Orthopedic Surgery, Otolaryngology, Physical Medicine, Preventive Medicine, Neurology, Mental/Behavioral Health, Nephrology, General Surgery, Vascular Surgery, Thoracic Surgery, Urology, Oncology, Rheumatology, Urgent Care, Skilled Nursing Facility

Comment: Two commenters provided feedback for measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented, citing that the measure developers should update the measure specifications to align with current Joint National Committee-8 (JNC-8), USPSTF, and American College of Physicians (ACP) clinical recommendations on blood pressure screening and management. Additionally, the denominator specifications should include exclusion criteria for patients with medical contraindications to treatment (for example, frail, elderly adults, patients with life limiting diagnoses). Another commenter expressed concerns about the numerator criteria for measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented. Specifically, the commenter stated that most doctors believe it goes against their medical training to recommend evaluation/referral to a primary care physician and/or lifestyle changes to someone who has a blood pressure reading of 122/82.

Response: We agree with aligning with the most current blood pressure guidelines. We disagree with the recommendation to exclude elderly, frail, or patients with life limiting diagnosis citing contraindications for treatment. In response to the commenters concerns regarding the numbers, for the 2019 performance period, this blood pressure value falls into the “Pre-Hypertensive BP Reading” classification. The recommendation may consist of a blood pressure rescreen within 1 year and promoting of physical activity, alcohol reduction, weight reduction or changes in diet which have limited contraindications to recommend. We may update the level of blood pressure reading in the future based on new blood pressure guidelines. We maintain the opinion this is a good measure since the new guidelines have not been widely accepted and will allow time for eligible clinicians to adopt the updated blood pressure values. This measure also encourages management of a prevalent condition.

Q321: CAHPS Clinician & Group Surveys (CG-CAHPS)-Adult, Child

Specialty Sets: Family Medicine, Internal Medicine

Comment: One commenter did not support measure Q321: CAHPS Clinician & Group Surveys (CG-CAHPS)-Adult, Child, citing that implementation could promote overuse of unnecessary treatments where the potential benefits do not outweigh the risk of harms (for example, opiate prescriptions, imaging studies). The commenter stated that developers do not present any evidence to form the basis of the measure and that validity of the survey process and the impact of survey results on improving patient outcomes is in question. Individual clinicians should not be held accountable to organizational factors beyond their control (for example, appointment wait times, and friendliness of staff).

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Response: We disagree that the CAHPS survey promotes the overuse of unnecessary treatments, but rather addresses the quality and appropriate access to healthcare services. While the survey does ask patients the level of friendliness of the staff, improving the patient experience throughout the course of treatment aligns with program goals.

Q322: Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Preoperative Evaluation in Low-Risk Surgery Patients

Specialty Sets: Cardiology

Comment: One commenter did not support measure Q322: Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Preoperative Evaluation in Low-Risk Surgery Patients. While this measure promotes appropriate use of cardiac stress imaging in low-risk surgery patients and cites clinical recommendations on perioperative evaluation of patients undergoing non-cardiac surgery to form the basis of the measure, developers do not cite a performance gap. Additionally, the denominator population is not specified for individual clinician use and clinicians may misinterpret the measure as currently written. The commenter recommended that developers consider revising the numerator to include cardiac stress images performed within 30 days preceding low-risk, non-cardiac surgery and the denominator specifications to include asymptomatic patients undergoing low-risk surgery.

Response: We continue to evaluate methods to display performance data. We have previously published Experience Reports to provide a detailed summary and continue to create meaningful benchmarks based on the submitted data. Performance data is evaluated annually to ensure the measure addresses a gap in care. The measure mimics the NQF #0670: Cardiac stress imaging not meeting appropriate use criteria: Preoperative evaluation in low risk surgery patients with minor updates regarding the timing of imaging assessment. The National Quality Forum indicated the level of analysis is based on the clinician, group/practice and facility data. We will provide the numerator language feedback to the measure steward. There is a numerator note included within the specification to provide submission guidance. We appreciate the revision suggestion to clarify the numerator, but the measure still addresses appropriate use of healthcare resources.

Q324: Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Testing in Asymptomatic, Low-Risk Patients

Specialty Sets: Cardiology

Comment: One commenter did not support measure Q324: Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Testing in Asymptomatic, Low-Risk Patients. The commenter stated that the numerator is not specified for individual clinician use, the measure does not specify a standardized approach to risk assessment, and it relies on the individual clinician's ability to appropriately document level of risk. Clinicians attest to the accuracy of their estimation by submission, but a stronger measure may specify a more systematic approach to risk assessment. Developers should consider revising the numerator specifications to include "healthy, low-risk patients."

Response: The measure directs clinicians should consider the maximum number of available patient factors used to estimate risk based on Framingham (ATP III criteria), typically age, gender, diabetes, smoking status, and use of blood pressure medication, and integrate age appropriate estimates for missing elements, such as LDL or standard blood pressure. The measure mimics the NQF #0672: Cardiac Stress Imaging Not Meeting Appropriate Use Criteria: Testing in Asymptomatic, Low-Risk Patients with language updates. The National Quality Forum indicated the level of analysis is based on the clinician, group/practice and facility data. We will provide the numerator language feedback to the measure steward. We appreciate the revision suggestion to clarify the numerator, but the measure still addresses appropriate use of healthcare resources.

Q325: Adult Major Depressive Disorder (MDD): Coordination of Care of Patients with Specific Comorbid Conditions

Specialty Sets: Mental/Behavioral Health

Comment: One commenter did not support measure Q325: Adult Major Depressive Disorder (MDD): Coordination of Care of Patients with Specific Comorbid Conditions, citing a lack of high quality evidence examining the impact of disease communication on meaningful clinical outcomes. Additionally, the measure specifications do not include appropriate exclusion criteria for patients with mild or stable depression. It is also burdensome for clinicians to retrieve specialists' reports for all patient visits, especially if the primary care clinician did not refer the patient to care.

Response: The cited guidelines recommend with substantial clinical confidence, patients with major depressive disorder will be evaluated by or receive treatment from other eligible clinicians in addition to the psychiatrist or behavioral health provider. If more than one eligible clinician is involved in providing the care, all treating clinicians should have sufficient ongoing contact with the patient and with each other to ensure that care is coordinated, relevant information is available to guide treatment decisions, and treatments are synchronized. In response to the concern of the diagnosis criteria, the diagnosis codes indicate major depressive disorder and need to be active at the date of the encounter. We disagree commenters concern that the measure is burdensome for eligible clinicians to retrieve specialists' reports. The intent of the measure is to promote care coordination by requiring the eligible clinician treating MDD to provide relevant information to the clinician treating the comorbid condition.

Q326: Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

Comment: One commenter supported measure Q326: Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy but stated that inclusion of broad exclusion criteria may discourage clinicians from prescribing therapy in patients where the benefits outweigh the risk of harms. The commenter suggested this issue be addressed by developers by explicitly defining denominator exclusion criteria to prevent underuse of anticoagulation therapy in clinically appropriate cases, and that denominator specifications should be updated to include the CHADs2VASc risk stratification tool.

Response: The denominator exclusion removes patients that have mitral stenosis, prosthetic heart valves, or transient or reversible cause of atrial fibrillation. Any documentation meeting the defined criteria would remove the patient from the measure and would not be evaluated for anticoagulation therapy. The 2018

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

measure specification was updated in during the previous measure revision cycle to utilize the CHADs2VASc risk stratification tool.

Q331: Adult Sinusitis: Appropriate Choice of Antibiotic Prescribed for Acute Sinusitis (Overuse)

Specialty Sets: Family Medicine, Internal Medicine, Emergency Medicine, Otolaryngology, Urgent Care,

Comment: One commenter did not support measure Q331: Adult Sinusitis: Appropriate Choice of Antibiotic Prescribed for Acute Sinusitis (Overuse). They cited that numerator specifications do not define an appropriate performance rate and a 0 percent performance rate will promote underuse of antibiotic therapy in appropriate treatment cases. Furthermore, the numerator specifications define “acute sinusitis” according to typical bacterial infection symptoms and it is appropriate to prescribe antibiotics to treat a bacterial infection. The commenter suggested that developers should consider revising denominator specifications to define “acute sinusitis” according to viral symptoms to prevent overuse of antibiotic therapy in viral sinusitis infections, and to align the measure with current clinical recommendations. The commenter supported inclusion of appropriate exclusion criteria, but cites that inclusion of broad exclusion criteria may provide opportunity for measure manipulation by reporting clinicians.

Response: The Centers for Disease Control and Prevention identifies that 98 percent of rhino sinusitis cases are viral. Treatment of these cases with antibiotics may increase patient harm and lead to antibiotic resistance. The numerator note adds clarification for inverse measures, which indicates as the performance rate trends towards 0 percent, quality increases. In response to manipulation of data, any claims submitted to the CMS are subject to an audit, inclusive of any performance data submitted to the quality program. The measure is specific to viral sinusitis, we do not agree that it promotes underuse of antibiotic therapy in the appropriate cases. The clinical recommendation within the measure specification includes diagnosis of acute bacterial rhino sinusitis when symptoms persist for at least 10 days or worsening of symptoms after initial improvement. The measure includes a denominator exception for a documented reason for antibiotic regimen prescribed within 10 days of symptom onset, which is appropriate for this inverse measure.

Q332: Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin with or without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use)

Specialty Sets: Family Medicine, Internal Medicine, Emergency Medicine, Otolaryngology, Urgent Care

Comment: One commenter did not support measure Q332: Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin with or without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use) as numerator specifications do not align with specialty society recommendations. The commenter suggested that developers update the measure specifications to encourage prescription of amoxicillin-clavulanate as first-line therapy in patients diagnosed with bacterial sinusitis. In addition, the measure specifications do not include exclusion criteria for patients who do not tolerate amoxicillin. About 30-40 percent of patients are bacterial resistant to amoxicillin therapy alone.

Response: The measure specification does include a denominator exception for a documented reason for not prescribing amoxicillin. The IDSA identifies their clinical recommendation of use of Amoxicillin-clavulanate rather than amoxicillin alone weighted as low strength and weak quality of evidence. The Centers for Disease Control and Prevention continue to recommend Amoxicillin or amoxicillin/clavulanate as the recommended first-line therapy in confirmed cases of bacteria sinusitis.

Q333: Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse)

Specialty Sets: Family Medicine, Internal Medicine, Emergency Medicine, Otolaryngology, Urgent Care

Comment: One commenter supported measure Q333: Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse) because it is clinically important to promote appropriate use of CT scans in patients diagnosed with acute sinusitis. However, the commenter stated that developers do not clearly define denominator exclusion criteria and as such, implementation could promote underuse of CT scans in clinically appropriate cases. Developers should consider revising exclusion criteria based on current guidelines.

Response: The measure includes a denominator exception for documented reasons of a CT scan ordered at the time of diagnosis which is appropriate for this inverse measure and would allow for use of CT scan for appropriate cases. We refer the commenter to the clinical recommendation statements within the measure specification that indicate that clinicians should not obtain radiographic imaging for patients presenting with uncomplicated acute rhino sinusitis (ARS) to distinguish ABRS from VRS, unless a complication or alternative diagnosis is suspected. Radiographic imaging of the paranasal sinuses is unnecessary for diagnosis in patients who already meet clinical diagnostic criteria for ABRS. Sinus involvement is common in documented viral URIs, making it impossible to distinguish ABRS from VRS based solely on imaging studies. This measure is intended to avoid costly diagnostic tests that do not improve diagnostic accuracy yet expose the patient to unnecessary radiation.

Q342: Pain Brought under Control within 48 Hours

Specialty Sets: Family Medicine, Internal Medicine

Comment: One commenter did not support measure Q342: Pain Brought under Control within 48 Hours as it is unclear whether implementation will produce reliable, meaningful results, and there is insufficient evidence to support the 48 hour time interval. Additionally, the specifications include an assessment tool is that is not well validated. Measure developers should consider modifying the specifications to include a more appropriate assessment tool (for example, Numeric Pain Rating Scale). The commenter stated this is an inappropriate internal medicine accountability measure.

Response: The measure is intended to evaluate the effectiveness and timeliness of initial pain management after the start of palliative care services vs. immediate pain control. It strives to incorporate the patient’s pain goals relative to perception of comfort rather than aiming for a specific numeric pain intensity rating. This is not a required measure and encourage eligible clinicians to select clinically appropriate measures.

Q357: Surgical Site Infection (SSI)

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Specialty Sets: Otolaryngology, General Surgery, Vascular Surgery

Comment: One commenter noted the Q357: Surgical Site Infection (SSI) measure lacks rigor, and the chance for misclassification of surgeons is high. The commenter stated that standardized risk adjustment methodologies are critical when comparing clinical outcomes across different registries/cohorts, yet surgical MIPS measures do not account for risk factors. For example, the commenter tested the SSI measure collected through the ACS Surgeon Specific Registry (SSR). The commenter compared the unadjusted SSI measure rates to the risk-adjusted SSI rates and found that approximately 50 percent of cases were misclassified when risk adjustment was not performed. Yet, CMS does not require the risk adjustment of the SSI measure.

Response: This measure is constructed so that risk adjustment is performed by the parsimonious dataset and aims to allow efficient data collection resources and data submission. In the prior PQRS program, risk-adjustment methodology was provided to vendors if they wanted to provide their clients with this comparison to other eligible clinicians. We do understand the concern of disparities and discussing mitigation strategies to not hold eligible clinicians to different standards for the outcomes of their patients with risk factors or degree of invasiveness. We do not want to mask potential disparities or minimize incentives to improve the outcomes for different patient populations and procedures. However, at this time, we do not require measures to be risk-adjusted. We believe this is still a valid measure to maintain within the program as the denominator is restricted. We will provide this feedback to the measure steward but encourage the commenter to collaborate with the measure steward as well.

Q370: Depression Remission at Twelve Months

Specialty Sets: Family Medicine, Internal Medicine, Mental/Behavioral Health, Geriatrics

Comment: One commenter did not support measure Q370: Depression Remission at Twelve Months, citing that the measure does not account for individual starting points for each patient and there is a lack of high-quality evidence to support the 12-month (+/- 30 days) time interval. The threshold of reaching a specific PHQ-9 score (<5) is arbitrary and does not take into account the individual starting points for each patient. The measure may unfairly penalize clinicians caring for severely depressed patients for their inability to satisfy the measure requirements and as such, this measure may encourage clinicians to overtreat patients for major depressive disorder. Many patients are unable to achieve a PHQ-9 score of <5 and the PHQ-9 is not necessarily the best tool to track patient remission. The commenter suggested that developers consider revising the denominator specifications to include additional depression remission tracking tools and that measure specifications exclude patients with dementia or severe cognitive impairments and patients permanently residing in nursing homes. Lastly, the commenter would be amenable to using this measure as a tracking mechanism but opposed any linkage to performance and payment.

Response: This measure is not intended to assess the depression response, but the remission. Full remission is defined as a 2-month period devoid of major depressive signs and symptoms (American Psychiatric Association, 2013). If using a PHQ-9 tool, remission translates to PHQ-9 score of less than 5 (Kroenke, 2001). We agree that depression response and remission take time. In the STAR*D study, longer times than expected were needed to reach response or remission. In fact, one-third of those who ultimately responded did so after 6 weeks. Of those who achieved remission by Quick Inventory of Depressive Symptomatology (QIDS), 50 percent did so only at or after 6 weeks of treatment (Trivedi, 2006). If the eligible clinician is seeing improvement, this measure encourages the continuation of treatment to reach remission. This can take up to 3 months. Relapse is common within the first 6 months following remission from an acute depressive episode; as many as 20-85 percent of patients may relapse (American Psychiatric Association, 2010). For that reason, we agree with the remission outcome be assessed at multiple points in time.

Q371: Utilization of the PHQ-9 Tool

Specialty Sets: Family Medicine, Internal Medicine, Mental/Behavioral Health

Comment: One commenter did not support measure Q371: Utilization of the PHQ-9 Tool although it is clinically important and could lead to the development of an accurate outcome measure by determining well validated levels of depression severity. The commenter stated there is insufficient evidence to support the 4-month time interval specified in the denominator and the 4-month measurement period is unclear as to whether it's one measurement within a 4-month period, or every 4 months for patients with an on-going disease diagnosis. Evidence supports utilization of the PHQ-9 tool, but many clinicians utilize additional remission screening tools that are equally as effective as the PHQ-9. The measure intends to assess performance at the system level. While this measure may appropriately assess the performance of mental health practitioners (for example, psychiatrist), it may be an inappropriate accountability measure for primary care clinicians who may encounter interoperability barriers to satisfy the measure requirements (for example, subspecialist reports).

Response: We have proposed substantive changes to this measure that address the commenter's concerns. The measure has been revised to assess both adolescent patients (12 to 17 years of age) and adult patients (18 years of age or older) with a diagnosis of major depression or dysthymia who have a completed PHQ-9 or PHQ-9M tool during the performance period. Regarding the interoperability barriers for primary care clinicians, this is not a required measure and encourage eligible clinicians to select measures that are clinically appropriate and align with their clinical workflow.

Q374: Closing the Referral Loop: Receipt of the Specialist Report

Specialty Sets: Cardiology, Gastroenterology, Dermatology, Family Medicine, Internal Medicine, Obstetrics/Gynecology, Ophthalmology, Orthopedic Surgery, Otolaryngology, Physical Medicine, Preventive Medicine, Neurology, Mental/Behavioral Health, Vascular Surgery, General Surgery, Thoracic Surgery, Urology, Oncology, Rheumatology

Comment: Two commenters provided feedback on measure Q374: Closing the Referral Loop: Receipt of the Specialist Report because it could lead to an unintended consequence of encouraging unnecessary care. One commenter provided a number of suggestions for measure developers: the specifications are not well defined and should include an evidence-based time interval and some element of risk-adjustment; there is not enough evidence cited to form the basis of the measure; the outcome is based on the level of integration of the participating information system rather than on how well the individual clinician tracks the referral; the data trail for submission may vary by submitter type; it is not necessary for clinicians to close all referral loops; and the patient may not see the specialist within the measurement period causing the referring clinician to fail the measure. Lastly, this measure may become less relevant due to the use of electronic health records (EHRs), and there is less evidence that this measure will improve care if it is implemented at the individual clinician level. One

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

commenter recommended that CMS work with measure developers to change Q374: Closing the Referral Loop: Receipt of Specialist Report from patient-based to episode-based because reports are associated with a specific encounter and it would reduce the timing complexity.

Response: We disagree that the measure encourages unnecessary care but promotes communication between eligible clinicians. We will evaluate the request to determine an appropriate timeframe but need to consider the variance between specialties and testing. As indicated within the comment, depending on the urgency to complete the referral within a given timeframe, the patient may not see the specialist. We agree the variance of timeframes may be mitigated by risk-adjustment but may overcomplicate the measure. We disagree that performance is based on the level of integration of information systems. Referral tracking methods should be developed within individual practices or networks. In response to the request to move towards episode-based reporting, the measure is specified at the patient-level and limited to the first referral of the measurement period to minimize reporting burden on clinicians. However, we received similar feedback from stakeholders during our periodic reassessment of the measure, and we are currently testing an episode-based revision to this measure. We will consider implementing the revised measure in future program years if it continues to meet our standards for feasibility, reliability, and validity. This measure promotes communication and care coordination no matter the method of referral tracking. We maintain the notion that Q374 is still a valid measure to promote care coordination based on the responses above.

Q377: Functional Status Assessment for Patients with CHF

Specialty Sets: Family Medicine, Internal Medicine

Comment: One commenter did not support measure Q377: Functional Status Assessment for Patients with CHF as it is unclear whether implementation of this measure will lead to meaningful improvements in quality outcomes and the measure developers do not cite a performance gap. Also, incentivizing clinicians to perform routine assessments in asymptomatic patients may result in underuse of more meaningful clinical interventions. The commenter supported valid, reliable patient reported outcome measures (PROMs), there says this measure has insufficient evidence to support the benefit of this intervention on quality outcomes. Implementation of evidence-based PROMs using validated instruments to assess clinical performance is likely the first step towards collecting PROM data. As currently specified, congestive heart failure is not clearly defined, and developers should consider revising the specifications to clearly differentiate between preserved ejection fraction and systolic dysfunction because this intervention will more likely lead to quality improvements in the latter population.

Response: We consulted with the measure steward and they will give consideration to providing further clarity on the definition of congestive heart failure included in the measure in the future.

Q387: Annual Hepatitis C Virus (HCV) Screening for Patients who are Active Injection Drug Users

Specialty Sets: Family Medicine, Internal Medicine, Infectious Disease

Comment: One commenter supported measure Q387: Annual Hepatitis C Virus (HCV) Screening for Patients who are Active Injection Drug Users. The commenter agreed that the implementation will likely lead to measurable and meaningful improvements in clinical outcomes and it aligns with USPSTF recommendations and other society recommendations. The commenter advised developers to address the following concerns during the update process: the benefit of diagnosing active injection drug users on injection habits is unclear and implementation is unlikely to largely benefit population health outcomes because most clinicians treat a low patient denominator for the measure; denominator specifications may not capture patients who deny injection drug use status and denominator specifications could be revised to be more inclusive of all patients at risk for HCV (for example, baby-boomer populations); and clinicians may encounter barriers to data access as information systems may not automatically identify the denominator population unless end users create a specific code to capture injection drug use.

Response: We will continue to monitor the level of impact to this patient population and will collaborate with the measure steward to potentially expand the patient population. However, we refer the commenter to measure Q400 One-Time Screening for Hepatitis C Virus for Patients at Risk that would include the requested patient population. We do not agree that data access will create any type of barrier. The data abstraction is not limited to a specific code or discrete data. As long as the medical record can substantiate the quality action, it would meet the intent of the measure.

Q390: Hepatitis C: Discussion and Shared Decision Making Surrounding Treatment Options

Specialty Sets: Gastroenterology

Comment: One commenter did not support measure Q390: Hepatitis C: Discussion and Shared Decision Making Surrounding Treatment Options because it ceases to be relevant in an era of superior pharmacologic treatment advancements. Newer treatments have minimal side effects, and therefore, decisions about tolerability are no longer applicable. Furthermore, measure developers do not cite any evidence to form the basis of the measure and do not include measurement validity or reliability data in the measure report. Additionally, the numerator specifications are unclear. Developers should consider revising the specifications to define explicit “shared decision making” documentation requirements. Lastly, patients who receive government funded insurance may encounter accessibility barriers to treatment options. It may inappropriate to base treatment options on shared- decision making alone because payers play a significant role in the therapy selection process.

Response: To meet the measure, there must be documentation in the patient record of a discussion between the physician or other qualified healthcare professional and the patient that includes all of the following: treatment choices appropriate to genotype, risks and benefits, evidence of effectiveness, and patient preferences toward treatment. This would include the superior pharmacologic treatment with consideration to financial burden. We do understand the concern of socioeconomic disparities and discussing mitigation strategies to not hold eligible clinicians to different standards for the outcomes of their patients with social risk factors. We do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations.

Q398: Optimal Asthma Control

Specialty Sets: Family Medicine, Internal Medicine, Otolaryngology, Pediatrics

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Comment: One commenter did not support measure Q398: Optimal Asthma Control, citing that implementation of the measure will likely prevent overuse of emergency department services to treat acute disease exacerbations. The commenter noted that measure developers did not cite enough evidence to form the basis of the measure, that measure specifications are difficult to navigate, and that the measure is not currently risk-adjusted for disease severity and socioeconomic status. Lastly, the commenter stated that the Asthma Control Test (ACT) is a best practice but it is a proprietary assessment tool.

Response: We will work with the measure steward to incorporate the citation within the specification. We have been trying to reduce the burden of reporting but disagree with the commenter indicating 6 components are required. It is only requiring 3 components: well-controlled, risk of exacerbation, and emergency visits. The measure is stratified by age to accommodate the age-specific assessment tools. The measure is not risk-adjusted at this time to address socioeconomic status but do not believe this should deter eligible clinician from making every effort to accommodate patients' financial situations. Eligible clinicians could provide sample controller medication to improve asthma control. We do understand the concern of socioeconomic disparities and discussing mitigation strategies to not hold eligible clinicians to different standards for the outcomes of their patients with social risk factors. We do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. The ACT may be proprietary, but the measure allows for additional asthma control tools to be utilized (Asthma Control Questionnaire or Asthma Therapy Assessment Questionnaire). We continue to evaluate methods to display performance data. We have previously published Experience Reports to provide a detailed summary and continue to create meaningful benchmarks based on the submitted data. We have explored alternative asthma measures that promote controller medication therapy over quick reliever medication, but unable to implement at the clinician level at this time. We agree that the goal is to achieve 100 percent adherence and will continue to collaborate with the measure steward to raise the Percentage Days Covered (PDC) to drive quality improvement. The measure is not risk-adjusted at this time to address socioeconomic status but do not believe this should deter adherence and all efforts should be made to accommodate patients' financial situations. As indicated within the comment, eligible clinicians could provide sample medication to improve patient adherence and alleviate financial burden. Medications dispensed as samples would be included within the PDC assessment. While this may pose difficulty in abstracting by pharmacy data, the medical record should capture this provision. Within the 2018 measure specification, there is a table that defines appropriate asthma controller medications. Based on the provided response, we maintain the notion this is an appropriate measure.

Q400: One-Time Screening for Hepatitis C Virus (HCV) for Patients at Risk

Specialty Sets: Family Medicine, Internal Medicine, Nephrology, Infectious Medicine

Comment: One commenter supported measure Q400: One-Time Screening for Hepatitis C Virus (HCV) for Patients at Risk. They agreed that a performance gap does exist, it is important to screen for HCV in patients at risk because it is a treatable disease, the measure aligns with CDC and USPSTF recommendations on screening for HCV in patients at risk and the measure specifications include appropriate exclusion criteria. However, the commenter stated that while the measure is clearly specified, clinicians may encounter interoperability barriers to patient information retrieval. One recommendation for the measure developers is to re-assess the benefit of screening all patients included in the denominator population during the measure update, particularly patients born in the years 1945-1965.

Response: We will forward the commenters suggestion to restrict the screening for patients born in the years 1945-1965. One-time HCV testing is recommended for persons born between 1945 and 1965 without prior ascertainment of risk (Rating: Class I, Level B) (AASLD/IDSA, 2017). However, the same commenter requested this population be added to measure Q387: Annual Hepatitis C Virus Screening for Patients who are Active Injection Drug Users. We will collaborate with all stakeholders to vet the appropriate patient population. The measure is currently appropriate for each separate patient populations. One requires an annual screening for high-risk active injection drug use, while the broader denominator requires a one-time screening which is appropriate for historical risk factors (born from 1945-1965, history of blood transfusion prior to 1992, hemodialysis, or history of drug use).

Q401: Hepatitis C: Screening for Hepatocellular Carcinoma (HCC) in Patients with Cirrhosis

Specialty Sets: Gastroenterology, Family Medicine, Internal Medicine

Comment: One commenter did not support measure Q401: Hepatitis C: Screening for Hepatocellular Carcinoma (HCC) in Patients with Cirrhosis because the screening benefits do not outweigh the substantial risks of harms related to radiation exposure and treatment of incidental findings. Developers cite weak evidence to form the basis of the measure, and a recent evidence review demonstrates insufficient evidence for screening for hepatocellular carcinoma among patients with cirrhosis.

Response: We will continue to monitor the clinical guidelines that suggest the benefits do not outweigh the risks. In regards to the comment, to weighing the risk versus benefits, the measure allows for a denominator exception for patient and medical reasons for not completing the screening.

Q402: Tobacco Use and Help with Quitting among Adolescents

Specialty Sets: Cardiology, Gastroenterology, Dermatology, Family Medicine, Internal Medicine, Obstetrics/Gynecology, Orthopedic Surgery, Otolaryngology, Pediatrics, Physical Medicine, Preventive Medicine, Neurology, Mental/Behavioral Health, General Surgery, Vascular Surgery, Thoracic Surgery, Oncology, Rheumatology, Urgent Care

Comment: One commenter supported measure Q402: Tobacco Use and Help with Quitting among Adolescents because, tobacco use is a modifiable risk factor and clinical evidence supports patient counseling. The commenter stated the denominator population is unclear, and the developer should consider separating the measure into two distinct measures: (1) tobacco use screening measure; and (2) tobacco cessation measure for patients who screened positive on measure 1.

Response: We do not agree in separating the measure into two distinct measures. We will provide your recommendation to the measure steward to stratifying the measure so to provide separate performance rates to identify areas where a gap exists.

Q408: Opioid Therapy Follow-Up and Evaluation

Specialty Sets: Family Medicine, Internal Medicine, Orthopedic Surgery, Physical Medicine, Neurology, Geriatrics

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Comment: One commenter did not support measure Q408: Opioid Therapy Follow-Up and Evaluation as it is a “check the box measure.” A more appropriate measure may incentivize a standardized, methodological approach to evaluation that is likely to improve the opioid therapy management process and result in improved clinical outcomes. There is insufficient evidence to support the 6 weeks and 3 months durations included in the denominator and numerator specifications. The commenter suggested that developers revise the specifications to include an evidence based-definition of chronic opioid therapy. Furthermore, it is unclear whether clinicians who prescribe therapy for less than 3 months should require patient follow-up earlier than 3 months’ time. The measure would benefit from reliability and validity testing prior to inclusion in quality payment programs.

Response: We agree with the commenter’s suggestion to revise the quality action to require follow up or mitigation plan if patient is not responding or misusing the opioid. We have collaborated with the measure steward to provide a definition of follow-up evaluation included in the 2019 measure specification. We will provide the commenter’s recommendation to the measure steward to align the denominator with the definition of chronic opioid therapy. However, we believe frequent patient education and follow-up regarding opioid use is necessary and aligns with our program goals to address the opioid epidemic.

Q411: Depression Remission at Six Months

Specialty Sets: Mental/Behavioral Health

Comment: One commenter did not support measure Q411: Depression Remission at Six Months, citing a lack of high-quality evidence to support the 6-month (+/- 30 days) time interval included in the numerator specifications and the threshold of reaching a specific PHQ-9 score (<5) is arbitrary, does not take into account the individual starting points for each patient, and is difficult for patients to achieve. The measure may also penalize clinicians caring for severely depressed patients for their inability to satisfy measure requirements and as such, this measure may encourage clinicians to over treat patients for major depressive disorder. The commenter recommended that developers: should consider revising the specifications to include risk adjustment to account for individual starting points for each patient; that PHQ-9 is not necessarily the best tool to track patient remission; that denominator specifications could be revised to include additional depression remission tracking tools; and that measure specifications exclude patients with dementia or severe cognitive impairments and patients permanently residing in nursing homes.

Response: This measure is not intended to assess the depression response, but the remission. Full remission is defined as a 2-month period devoid of major depressive signs and symptoms (American Psychiatric Association, 2013). If using a PHQ-9 tool, remission translates to PHQ-9 score of less than 5 (Kroenke, 2001). We agree that depression response and remission take time. In the STAR*D study, longer times than expected were needed to reach response or remission. In fact, one-third of those who ultimately responded did so after 6 weeks. Of those who achieved remission by Quick Inventory of Depressive Symptomatology (QIDS), 50 percent did so only at or after 6 weeks of treatment (Trivedi, 2006). If the eligible clinician is seeing improvement, this measure encourages the continuation of treatment to reach remission. This can take up to 3 months. Relapse is common within the first 6 months following remission from an acute depressive episode; as many as 20-85 percent of patients may relapse (American Psychiatric Association, 2010).

Q412: Documentation of Signed Opioid Treatment Agreement

Specialty Sets: Family Medicine, Internal Medicine, Orthopedic Surgery, Physical Medicine, Neurology, Geriatrics

Comment: One commenter supported measure Q412: Documentation of Signed Opioid Treatment Agreement because it protects clinicians from the repercussions of patients who violate the opioid agreement. Also, considering the magnitude and urgency of the opioid epidemic, quality programs should adopt this measure unless data is otherwise available to describe the negative consequences of this measure. The commenter suggested that developers update the measure specifications to include appropriate exclusion criteria for patients receiving active cancer treatment, and patients receiving palliative and end-of-life care.

Response: We agree with the commenter’s suggestion to exclude patients who are undergoing active cancer treatment and who are receiving palliative and end-of-life care. We have previously collaborated with the measure steward to add a hospice exclusion for the 2019 performance period. We encourage the commenter to review the measure specification when published.

Q414: Evaluation or Interview for Risk of Opioid Misuse

Specialty Sets: Family Medicine, Internal Medicine, Orthopedic Surgery, Physical Medicine, Neurology, Geriatrics

Comment: One commenter supported measure Q414: Evaluation or Interview for Risk of Opioid Misuse because implementation will likely lead to measurable and meaningful improvements in patient outcomes and prevent the misuse and abuse of opioid prescription therapy. However, the commenter stated that evidence exists to suggest that opioid addiction develops in less than 6 weeks duration of prescribed therapy, so the measure could unfairly penalize clinicians who do not initiate opioid therapy. Measure developers should consider updating the denominator specifications to include an evidence-based therapy duration. Also, the opioid measures would benefit from additional testing to determine which interventions are most impactful in preventing opioid misuse and abuse, exclusion criteria could include patients receiving active cancer treatment, palliative care, and end-of-life care.

Response: We agree with the commenter’s suggestion to exclude patients undergoing active cancer treatment, receiving palliative and end-of-life care. We have collaborated with the measure steward to add a hospice exclusion for the 2019 performance period. We encourage the commenter to review the measure specification when published. In addition, we will provide the commenter’s recommendation to the measure steward to align the denominator with the definition of chronic opioid therapy. The revision of chronic opioid therapy does not make this an invalid measure as it promotes risk assessment for a large opioid epidemic.

Q418: Osteoporosis Management in Women who had a Fracture

Specialty Sets: Family Medicine, Internal Medicine, Obstetrics/Gynecology, Orthopedic Surgery

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Comment: One commenter supported measure Q418: Osteoporosis Management in Women who had a Fracture because a performance gap exists, the specifications align with current recommendations to screen for osteoporosis in women aged 65 years and older, and specifications include appropriate exclusion criteria for women with fracture related to traumatic injury. The commenter stated that implementation may promote overuse of bone mineral density testing, and developers should consider tapering the fracture definition to only include women with vertebral and hip fractures.

Response: We do not agree that it would promote overuse of screening as it allows a 2-year timeframe for completing the bone mineral density test. In addition, an eligible clinician can meet the intent of the measure by pharmacotherapy. Eligible clinicians are expected to coordinate their care with eligible clinicians. We will provide feedback to the measure steward regarding the narrowing of eligible ICD10 codes and possibly incorporated in a future annual revision process. In response to the commenter's request to include a hospice exclusion, this is included within the measure specification.

Comment: For measure Q418: Osteoporosis Management in Women Who Had a Fracture, one commenter stated that there is a disconnect between this quality measure and the communication and care transition quality measure application to the clinician treating the fracture. The commenter urged CMS to align measure Q418 with clinical guidelines recommending that patients with a history of hip or vertebral fracture receive (or are offered) pharmacotherapy to treat osteoporosis.

Response: This measure promotes further evaluation or pharmacotherapy to treat osteoporosis for patients experiencing a fracture. U.S. Food and Drug Administration approved pharmacologic options for osteoporosis prevention and/or treatment of postmenopausal osteoporosis include, in alphabetical order: bisphosphonates (alendronate, alendronate-cholecalciferol, ibandronate, risedronate, zoledronic acid, calcitonin, teriparatide, denosumab, and raloxifene).

Q419: Overuse of Imaging for Patients with Primary Headache and a Normal Neurological Evaluation

Specialty Sets: Neurology

Comment: One commenter supported measure Q419: Overuse of Imaging for Patients with Primary Headache and a Normal Neurological Evaluation. However, the commenter stated that measure developers cite outdated evidence to form the basis of the measure. Additionally, quality reporting programs should be aware of the potential for clinicians to manipulate the measure to work in their favor by documenting an exception to the rule (for example, "change in the type of headache"). To avoid potential measure gaming, developers should consider revising the specifications to clearly define appropriate exceptions to eligibility.

Response: In response to the outdated guidelines concern, we encourage the commenter to review the substantively updated measure specification that reflect the most recent guidelines. Eligible clinicians should not change their billing or documentation to manipulate eligibility or performance. Any claims submitted to the CMS are subject to an audit, inclusive of any performance data submitted to the quality program.

Q431: Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling

Specialty Sets: Cardiology, Gastroenterology, Family Medicine, Internal Medicine, Obstetrics/Gynecology, Otolaryngology, Physical, Medicine, Preventive Medicine, Mental/Behavioral Health, Urology, Oncology, Urgent Care

Comment: One commenter supported measure Q431: Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling because it is clinically important to screen for unhealthy alcohol use. They agreed that the measure aligns with the United States Preventive Services Task Force (USPSTF) recommendations on screening and behavioral health counseling interventions in primary care, and the measure does not pose undue burden on clinicians. The commenter suggested the developers revise the numerator specifications to clearly define "brief counseling."

Response: We direct the commenter to the measure specification that defines brief counseling: Brief counseling for unhealthy alcohol use refers to one or more counseling sessions, a minimum of 5-15 minutes, which may include: feedback on alcohol use and harms; identification of high risk situations for drinking and coping strategies; increased motivation and the development of a personal plan to reduce drinking.

Q435: Quality of Life Assessment for Patients with Primary Headache Disorders

Specialty Sets: Neurology

Comment: One commenter did not support measure Q435: Quality of Life Assessment for Patients with Primary Headache Disorders because it cannot estimate the measure impact on improved clinical outcomes. The commenter stated that following on the measure specifications: denominator specifications include exclusion criteria for patients without insurance to cover assessment costs, reinforcing uncertainty surrounding the intervention's ability to improve quality outcomes; the numerator specifies an assessment tool that is specific to migraine headaches; and as currently specified, clinicians are required to perform quality of life assessments on all patients with primary headache disorders, regardless of clinical relevance to the patient's primary complaints. Developers should consider revising the specifications to include a principle diagnosis of primary headache and more meaningful, evidence-based interventions.

Response: We disagree with the commenter's assessment of the measure and refer the commenter to review the MIPS quality measure. It does not have an exclusion for patients without insurance to cover assessment costs. The measure does provide a list of quality of life tools applicable to this specific patient population: Migraine Disability Assessment (MIDAS) and PedMIDAS (proprietary); Headache Impact Test-6 (HIT-6)(proprietary); Migraine Specific Quality of Life Tool (MSQ); Neck Disability Index (NDI)-used for cervicogenic headaches; McGill Questionnaire. This measure may be submitted by eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding. The eligible clinician would only submit the measure if there was a qualifying encounter(s).

Q438: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Preventive Medicine

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

Comment: One commenter supported measure Q438: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease based on an increase in the performance gap due to new guidelines, available evidence and that measure specifications include appropriate exclusion criteria for patient intolerance. The commenter noted that implementation of statin therapy alone does not guarantee meaningful improvements in clinical outcomes. A more meaningful measure may examine patient adherence to prescribed statin therapy. Additionally, a high percentage of patients prescribed statin therapy for the management of cardiovascular disease exacerbations (for example, acute MI) discontinue therapy without consulting their clinician. However, the measure may unfairly penalize clinicians for lack of control over non-adherent patients.

Response: We will evaluate the commenter's request for adding an adherence component, but the commenter also cited concerns that this may not attribute to the eligible clinician due to lack of control of non-adherent patients. Based on the commenter's feedback to add adherence but caution adherence would out of the eligible clinician's control, we maintain the notion this is a good measure.

Q441: Ischemic Vascular Disease: All or None Outcome Measure

Specialty Sets: Cardiology, Family Medicine, Internal Medicine, Vascular Surgery

Comment: One commenter did not support measure Q441: Ischemic Vascular Disease: All or None Outcome Measure, citing that it did not receive adequate information from the developer for review and that it rated the measure based on the specifications provided on the MIPS website. The commenter stated the measure because it disregards patient preferences, specifications do not consider factors beyond the clinician's control, and it does not align committee recommendations for hypertension management.

Response: We agree with updating the numerator to reflect the updated blood pressure values and have been discussing the revision with the measure steward. We maintain the opinion this is a good measure since the new guidelines have been controversial and encourages comprehensive management of a prevalent condition.

Q442: Persistence of Beta-Blocker Treatment after a Heart Attack

Specialty Sets: Cardiology, Family Medicine, Internal Medicine

Comment: One commenter supported measure Q442: Persistence of Beta-Blocker Treatment after a Heart Attack, citing high-quality evidence from the most recent recommendations of various organizations. The commenter noted this measure is close to being topped out.

Response: We encourage the commenter to review the most current MIPS performance data when available.

Q443: Non-Recommended Cervical Cancer Screening in Adolescent Females

Specialty Sets: Family Medicine, Internal Medicine, Obstetrics/Gynecology

Comment: One commenter supported measure Q443: Non-Recommended Cervical Cancer Screening in Adolescent Females because implementation will likely promote appropriate use of cervical cancer screening in adolescents, the measure is well specified, and specifications include appropriate exclusion criteria for women diagnosed with HIV. The measure also aligns with USPSTF recommendations on cervical cancer screening. However, the commenter noted that earlier screening is not as effective and that the evidence base would benefit from re-evaluation as data surfaces on the benefits and risks of screening in women < 20 years old. Because the performance gap is not cited in the measure report, it is difficult to estimate the potential impact of the measure on quality outcomes.

Response: We continue to evaluate methods to display performance data. We have previously published Experience Reports to provide a detailed summary and continue to create meaningful benchmarks based on the submitted data. The measure aligns with United States Preventive Services Task Force recommendations on cervical cancer screening in addition to the ACOG and ASCCP guidelines. We will continue to monitor for updated cervical cancer screening guidelines and collaborate with the measure steward to align with any updated guidelines.

Q444: Medication Management for People with Asthma

Specialty Sets: Family Medicine, Internal Medicine, Pediatrics

Comment: One commenter supported measure Q444: Medication Management for People with Asthma because implementation may promote patient adherence to prescribed controller medication therapy. However, the commenter indicated the following concerns: the performance gap is not cited; there is no evidence cited to support the Percentage of Days Covered (PDC) threshold; the measure is not risk-adjusted for disease severity or socioeconomic status and implementation; the measure numerator should clearly specify an appropriate asthma controller medication list; the measure could unfairly penalize clinicians who encounter interoperability barriers to data retrieval; the measure uses pharmacy data to track medication adherence where lower socioeconomic patients may encounter cost barriers and adherence issues; and lastly, the measure assesses quality at the system level where individual clinicians may encounter interoperability barriers to data retrieval.

Response: We continue to evaluate methods to display performance data. We have previously published Experience Reports to provide a detailed summary and continue to create meaningful benchmarks based on the submitted data. We have explored alternative asthma measures that promote controller medication therapy over quick reliever medication, but unable to implement at the clinician level at this time. We agree that the goal is to achieve 100 percent adherence and will continue to collaborate with the measure steward to raise the Percentage Days Covered (PDC) to drive quality improvement. The measure is not risk-adjusted at this time to address socioeconomic status but do not believe this should deter adherence and all efforts should be made to accommodate patients' financial situations. We do understand the concern of socioeconomic disparities and discussing mitigation strategies to not hold eligible clinicians to different standards for the outcomes of their patients with social risk factors. We do not want to mask potential disparities or minimize incentives to improve the outcomes for disadvantaged populations. As indicated within the comment, eligible clinicians could provide sample medication to improve patient adherence

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

and alleviate financial burden. Medications dispensed as samples would be included within the PDC assessment. While this may pose difficulty in abstracting by pharmacy data, the medical record should capture this provision. Within the 2018 measure specification there is a table that defines appropriate asthma controller medications. Based on the provided response, we maintain the notion this is an appropriate measure.

Specialty Measure Sets: Cardiology, General Surgery, Skilled Nursing Facility

Comment: One commenter encouraged CMS to add the following immunization quality measures into a new Endocrinology specialty measure sets:

- **Cardiology** - Q474: Zoster (Shingles) Vaccination; Q110: Preventive Care and Screening: Influenza Immunization and Q111: Pneumonia Vaccination Status for Older Adults
- **General Surgery** - Q110: Preventive Care and Screening: Influenza Immunization and Q111: Pneumonia Vaccination Status for Older Adults
- **Skilled Nursing Facility** - Q111: Pneumonia Vaccination Status for Older Adults
- **Endocrinology** - Q474: Zoster (Shingles) Vaccination; Preventive Care and Screening: Influenza Immunization and Q111: Pneumonia Vaccination Status for Older Adults

Response: We thank the commenter for the recommendation to create an Endocrinology specialty measure set and to add these measures to existing specialty measure sets for Cardiology, General Surgery, and Skilled Nursing Facility. Prior to rulemaking we solicit feedback from stakeholders with regards to measures that should be added or removed to existing specialty sets or the development of new specialty sets. Specific measure to create an Endocrinology specialty measure set were not suggested as part of the feedback received from specialty stakeholders for the 2019 performance period. We ask the commenter to submit their feedback during this solicitation process for future consideration in rulemaking. This allows stakeholder to provide feedback to the specialty set proposed prior to the finalization of the specialty set. We do not agree with the recommendation to include Q110, Q111, and Q474 to the Cardiology and General Surgery specialty sets as the patient would likely be referred to the PCP to receive immunizations. While we agree that Q111 may apply to Skilled Nursing Facilities, the denominator coding does not support this request.

Specialty Measure Set: Allergy/Immunology (A/I)

Comment: One commenter expressed concerns with the Allergy/Immunology (A/I) Specialty Measure Set, which they noted includes measures that are not pertinent to our Allergy/Immunology Specialty. Given A/I specialists do not diagnose, treat or manage HIV/AIDS, measures related to this disease do not belong in the A/I Specialty Measure Set. Therefore, the commenter requested that CMS remove the following measures: Measure 160: HIV/AIDS: Pneumocystis Jiroveci Pneumonia (PCP) Prophylaxis; Measure 338: HIV Viral Load Suppression; Measure 340: HIV Medical Visit Frequency.

In addition, the commenter noted that A/I specialists do diagnose, treat and frequently manage sinusitis and asthma, therefore, they requested that CMS return the following measures to the A/I Specialty Measure Set: Measure 331: Adult Sinusitis: Antibiotic Prescribed for Acute Sinusitis, Measure 332: Adult Sinusitis: Appropriate Choice of Antibiotic.

Response: Prior to rulemaking we solicit feedback from stakeholders with regards to measures that should be added or removed to existing specialty sets or the development of new specialty sets. The suggestion to remove the measures from the Allergy/Immunology specialty measure set was not provided as part of the feedback received from specialty stakeholders for the 2019 performance period. We ask the commenter to submit their feedback during this solicitation process for future consideration in rulemaking.

Specialty Measure Set: Dentistry

Comment: One commenter supported the inclusion of measure Q379: Primary Caries Prevention Intervention as Offered by Primary Care Providers, including Dentists, but stated the measure specifications do not reflect the best clinical evidence. Existing clinical recommendations recommend that topical fluoride be applied more frequently than once per year and as often as every 3 months for children at elevated risk for dental caries. The commenter recommended that this measure be amended to reflect increased risk for tooth decay in line with the existing pediatric measure set developed by the Dental Quality Alliance (DQA). The commenter also supported the inclusion of measure Q378: Children Who Have Dental Decay or Cavities, as it represents the type of outcome measures that oral health care has long been lacking. However, there has been no visible progress in developing or testing this measure for use by Medicaid programs. The commenter requested that CMS transfer the measure stewardship for measures Q378 and Q379 to the DQA, which was as established at the request of CMS to serve as a multi-stakeholder organization focused on oral health quality measurement and improvement. Furthermore, the commenter noted that two additional measures have been developed by the DQA through support from the Office of National Coordinator for Health Information Technology (ONC) and tested for validity, reliability, feasibility and usability for use at the clinicians level and rely on standard data elements in electronic health records and are specified precisely using the Measure Authoring Tool based on the Quality Data Model and value sets.

Response: We thank the commenter for feedback that this outcome measure is not risk adjusted for clinical or sociodemographic factors. We support the goal of identifying and reducing disparities in health and healthcare. We will explore risk adjustment for this measure and the potential impact on clinician burden in the next update period. Thank you for bringing up the current evidence-based clinical recommendations and the need to incorporate within this measure. We will review these recommendations in the next update period. With regard to the DQA and measure stewardship, we seek collaborative partnerships and engagement with stakeholders in the development and continued maintenance of important, feasible, reliable, valid, and useful measures and appreciates the opportunity to engage the current measure steward and other stakeholders. Thank you for your comments on the need for additional measures for dental professionals and your recommendations to improve the current program dental measures. We will take your suggestions under consideration as we continue to review and update program measures. We provide opportunities for introducing new measures into programs through an annual call for measures and encourage the commenter to submit measures and measure concepts at the next Call for Measures solicitation.

General Comments

Comment: One commenter supported the inclusion of a number of dementia and cognitive impairment measures in MIPS. The commenter urged CMS to develop quality measures related to mild cognitive impairment and its detection for future years. The commenter further urged CMS to include the cognitive impairment quality measures currently under development by the measure steward when they are finalized. The commenter also stated that cognitive impairment detection is the only aspect of the Annual Wellness Visit that is not fully reinforced with clinicians through MIPS quality measures. The existing

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes.

dementia-related quality measures apply solely to patients who have already been diagnosed with dementia, and do not reflect overall incorporation of the required cognitive impairment component in the AWV. The Quality Payment Program, therefore, perpetuates ADRD under diagnosis and impedes appropriate interventions for patients and their families.

Response: We encourage the comment to collaborate with measure developers to submit measures to the Call for Measures process for future implementation.

Comment: One commenter urged CMS to adopt the following malnutrition eQMs adopted by the National Quality Forum 14: NQF #3087/MUC16-294: Completion of a Malnutrition Screening within 24 hours of Admission; NQF #3088/MUC16-296: Completion of a Nutrition Assessment for Patients Identified as At Risk for Malnutrition within 24 hours of a Malnutrition Screening; NQF #3089/MUC16-372: Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment; NQF #3090/MUC16-344: Appropriate Documentation of a Malnutrition Diagnosis. A second commenter indicated that given the demonstrated gap, it is critical that CMS act quickly to use its statutory authority through direction of the national quality strategy and focus on malnutrition care in the hospital. Malnutrition should be a priority area for CMS, as malnutrition care aligns with the main principles of the Meaningful Measures Initiative.

Response: We encourage the commenter to collaborate with the measure steward of the mentioned measures and submit to the Call for Measures process under the MIPS program. The referenced measures were submitted to the Hospital Inpatient Quality Reporting program, but not for MIPS consideration.

Comment: One commenter was disappointed that adult immunization quality measures were not included in a few key specialty areas who care for chronically ill patients at-risk of serious complications from vaccine preventable illness. The Advisory Committee on Immunization Practices (ACIP) includes age-based, as well as condition-specific recommendations for adult vaccination. For pregnant women, ACIP recommends a Tdap vaccination. We are pleased that efforts to develop a composite Tdap/influenza measure for pregnant women has completed testing and is now under review by the National Committee for Quality Assurance (NCQA). The commenter noted they look forward to further dialogue with CMS on this topic as it moves forward. In addition, patients living with chronic conditions such as heart disease and diabetes are at a significantly higher risk of complications and death from influenza and pneumonia. The CDC has reported that in 2013 only 21.2 percent of adults in this group had received a pneumococcal vaccination, and this number has remained unchanged for at least a decade. Individuals with diabetes are at increased risk for hepatitis B infection. As such, the ACIP recommends hepatitis B vaccination for all patients with diabetes age 6011 and under, as well as other at-risk patients, such as those living with HIV/AIDS and chronic kidney disease.

Response: We appreciate the support for the pneumococcal quality measures. We agree this is an important public health issue. We continue to explore opportunities to implement a composite adult vaccination measure for future implementation. We encourage the commenter to work with measure developers to submit the immunization measures to the Call for Measures process. We did add adult immunization measures to the existing Oncology and Internal Medicine specialty measure set, as well as new specialty measure set.

Comment: A few commenters supported the proposal to remove six measures from CMS Web Interface reporting criteria.

Response: We thank the commenters for their support. Note: Because measure Q318 is not finalized for removal from the MIPS program in this final rule, there are now five measures that will be finalized in this final rule with the change to remove the CMS Web Interface data collection type.

Comment: Concerning the quality category proposed to be weighted at 45 percent in Year 3 continuing to represent the performance category with the greatest contribution to a clinician's final score in MIPS, commenters noted that this performance category still represents the greatest challenge for chiropractic clinicians due to the limited CPT codes the provider is reimbursed by CMS. These codes are currently limited to two clinical quality measures, specifically #131 & #182. These measures have a high risk of being removed based on the proposed rule for topped out measures in Year 3, leaving the chiropractic clinician forced to bill his/her Medicare patients out of pocket expenses to report other quality measures.

Response: We encourage stakeholders to submit feedback on specific MIPS quality measures where they believe codes should be added to reflect a specialty practice not currently reflected in a given measure. We would take that feedback into consideration, and if we agree with the recommendation, could communicate such recommendations to the measure stewards for their consideration. MIPS eligible clinicians should report on quality measures that are meaningful to their practice and within the scope of the care they provide. We note that chiropractor clinician codes have been added to the following measures for the 2019 performance period: Quality ID# 217: Functional Status Change for Patients with Knee Impairments; Quality ID# 218: Functional Status Change for Patients with Hip Impairments; Quality ID# 219: Functional Status Change for Patients with Foot or Ankle Impairments; Quality ID#220: Functional Status Change for Patients with Lumbar Impairments; Quality ID#221: Functional Status Change for Patients with Shoulder Impairments; Quality ID#222: Functional Status Change for Patients with Elbow, Wrist or Hand Impairments; and Quality ID#223: Functional Status Change for Patients with Other General Orthopaedic Impairments. We remind all clinicians that they should bill Medicare only for services that are reasonable and necessary. We encourage MIPS eligible clinicians to review the list of MIPS quality measures and QCDR measures available for quality reporting in order to report on measures that are meaningful to their scope of practice. We believe it is important to gradually remove topped out measures from the program as they demonstrate high, unvarying performance with no gaps for quality improvement.

APPENDIX 2: Improvement Activities

NOTE: For previously finalized improvement activities, we refer readers to the finalized Improvement Activities Inventory in Table F in the Appendix of the CY 2018 Quality Payment Program final rule (82 FR 54175) and in Table H in the Appendix of the CY 2017 Quality Payment Program final rule (81 FR 77818). Unless modified or removed in the CY 2019 Physician Fee Schedule final rule, previously finalized improvement activities continue to apply for the MIPS CY 2019 performance period and future years.

We refer readers to the CY 2018 Quality Payment Program final rule (82 FR 53569) for previously adopted criteria for nominating new improvement activities. We refer readers to section III.I.3.h.(4)(d)(i) of this final rule, where we are finalizing our proposals to add one new criterion and remove a previously adopted criterion. In addition, we refer readers to section III.I.3.h.(4)(d)(i) of this final rule where we clarify: (1) considerations for selecting improvement activities for the CY 2019 performance period and future years; and (2) the weighting of improvement activities. In the CY 2019 PFS proposed rule (83 FR 36359), for CY 2019 performance period and future years we proposed: six (6) new improvement activities; the modification of five (5) existing activities; and the removal of one (1) existing activity. These are discussed in greater detail below.

TABLE A: New Improvement Activities for the MIPS CY 2019 Performance Period and Future Years

Proposed Improvement Activity	
Proposed Activity ID:	IA_AHE_7
Proposed Subcategory:	Achieving Health Equity
Proposed Activity Title:	Comprehensive Eye Exams
Proposed Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by providing literature and/or facilitating a conversation about this topic using resources such as the “Think About Your Eyes” campaign ⁸⁴ and/or referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology’s EyeCare America ⁸⁵ and the American Optometric Association’s VISION USA. ⁸⁶ This activity is intended for: (1) non-ophthalmologists/optometrist who refer patients to an ophthalmologist/optometrist; (2) ophthalmologists/optometrists caring for underserved patients at no cost; or (3) any clinician providing literature and/or resources on this topic. This activity must be targeted at underserved and/or high- risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams.
Proposed Weighting:	Medium
Rationale:	This activity fills a gap as the Inventory does not currently contain an activity related to ophthalmology. Furthermore, we believe promoting and educating patients about the importance of a comprehensive eye exam can improve access to this service and, in turn, improve health status particularly for traditionally underserved populations or to those who are otherwise unable to access these important services. For these reasons, we believe this activity meets the inclusion criteria of an activity that could lead to improvement in practice to

⁸⁴ The Think About Your Eyes resource at <http://thinkaboutyoureyes.com>.

⁸⁵ The American Academy of Ophthalmology’s EyeCare America resource at <https://www.aao.org/eyecare-america>.

⁸⁶ The American Optometric Association’s VISION USA resource at <http://www.aoafoundation.org/vision-usa/>.

	reduce health care disparities. We proposed the weighting of this activity as medium because this activity may be accomplished by providing literature and/or facilitating a conversation with a patient during a regular visit. This task may be incorporated into a patient's regular visit with a relatively low investment of time or resources
Comments:	Several commenters supported the inclusion of this improvement activity. Commenters stated that the activity will have positive clinical impacts on patients. In addition, routine eye exams can identify both ocular conditions as well as other health problems, including serious conditions like brain tumors, thyroid disease, and pituitary tumors. Another commenter supported improvement activities that specifically promote health equity, the goal of this improvement activity. One commenter recommended this improvement activity not be finalized due to concern that comprehensive eye exams are not appropriate for most healthy populations and should only be targeted to those at risk. The commenter stated the improvement activity may lead to increases in unnecessary expenditures for public programs and low income patients.
Response:	We believe this improvement activity will have a positive impact on patient care and promote health equity. Regarding the commenter's concern that this improvement activity may lead to the provision of comprehensive eye exams for those who are not at risk, as stated in the description, "this activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams." Therefore, we believe that the improvement activity is appropriately targeted at populations with the highest risk for conditions that can be detected through a comprehensive eye exam. Additionally, since comprehensive eye exams are relatively low cost interventions and early detection of conditions that can be identified through an eye exam may reduce more costly treatment later, we believe this improvement activity will not unnecessarily increase expenditures for public programs and the target population.
Final Action:	After consideration of the public comments received, we are finalizing this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_AHE_7
Subcategory:	Achieving Health Equity
Activity Title:	Comprehensive Eye Exams
Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by providing literature and/or facilitating a conversation about this topic using resources such as the "Think About Your Eyes" campaign ⁸⁷ and/or referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology's EyeCare America ⁸⁸ and the American Optometric Association's VISION USA. ⁸⁹ This activity is intended for: (1) non-ophthalmologists/optometrist who refer patients to an ophthalmologist/optometrist; (2) ophthalmologists/optometrists caring for underserved patients at no cost; or (3) any clinician providing literature and/or resources on this topic. This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams.
Weighting:	Medium
Proposed Improvement Activity

⁸⁸ The American Academy of Ophthalmology's EyeCare America resource at <https://www.aao.org/eyecare-america>.

⁸⁹ The American Optometric Association's VISION USA resource at <http://www.aoafoundation.org/vision-usa/>.

Proposed Activity ID:	IA_BE_24
Proposed Subcategory:	Beneficiary Engagement
Proposed Activity Title:	Financial Navigation Program
Proposed Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must attest that their practice provides financial counseling to patients or their caregiver about costs of care and an exploration of different payment options. The MIPS eligible clinician may accomplish this by working with other members of their practice (for example, financial counselor or patient navigator) as part of a team-based care approach in which members of the patient care team collaborate to support patient- centered goals. For example, a financial counselor could provide patients with resources with further information or support options, or facilitate a conversation with a patient or caregiver that could address concerns. This activity may occur during diagnosis stage, before treatment, during treatment, and/or during survivorship planning, as appropriate.
Proposed Weighting:	Medium
Rationale:	We believe there is the possibility for improved outcomes when financial navigation programs are in place, such as reducing patient anxiety about costs and improved access to care for underserved populations. For these reasons, we believe this activity meets the inclusion criteria of an activity that could lead to improvement in practice to reduce health care disparities. We proposed the weighting of this activity as medium because the activity may be accomplished by providing literature and/or facilitating a conversation with a patient during a regular visit. This task may be incorporated into a patient's regular visit with a relatively low investment of time or resources.
Comments:	Several commenters supported the inclusion of this improvement activity. One commenter noted that this improvement activity may be challenging for clinicians, especially those in smaller practices who have difficulty accessing cost of care data and should therefore be weighted as high. Another commenter provided support for the inclusion of this improvement activity as proposed because this improvement activity is likely to have a large impact on patients with serious illnesses who are at high risk for medical debt and its related problems, and recommended we remain flexible in the members of the patient care team that can provide financial navigation services.
Response:	As explained in section III.I.3.h.(4)(d)(i)(C) of this final rule, the weighting of "medium" is in accordance with our policy, as high weighting should be used for activities that directly address areas with the greatest impact on beneficiary care, safety, health, and well-being and/or is of high intensity, requiring significant investment of time and resources. We do not believe accessing cost of care data requires a significant investment of time and resources, even for smaller practices, and therefore, we do not believe a high weighting is warranted. We appreciate the supportive comment that this improvement activity will have an impact on patients with serious illnesses who are at risk for medical debt. Regarding the comment that we remain flexible in the members of the patient care team that can provide financial navigation services, the activity description states that the MIPS eligible clinician may meet this improvement activity by working with other members of the patient care team, including financial counselors or patient navigators and we intend to continue this flexibility.
Final Action:	After consideration of the public comments received, we are finalizing this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_BE_24
Subcategory:	Beneficiary Engagement
Activity Title:	Financial Navigation Program
Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must attest that their practice provides financial counseling to patients or their caregiver

	about costs of care and an exploration of different payment options. The MIPS eligible clinician may accomplish this by working with other members of their practice (for example, financial counselor or patient navigator) as part of a team-based care approach in which members of the patient care team collaborate to support patient-centered goals. For example, a financial counselor could provide patients with resources with further information or support options, or facilitate a conversation with a patient or caregiver that could address concerns. This activity may occur during diagnosis stage, before treatment, during treatment, and/or during survivorship planning, as appropriate.
Weighting:	Medium
Proposed Improvement Activity	
Proposed Activity ID:	IA_BMH_10
Proposed Subcategory:	Behavioral and Mental Health
Proposed Activity Title:	Completion of Collaborative Care Management Training Program
Proposed Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must complete a collaborative care management training program, such as the American Psychological Association (APA) Collaborative Care Model training program available as part of the Centers for Medicare & Medicaid Services (CMS) Transforming Clinical Practice Initiative (TCPI), ⁹⁰ available to the public, ⁹¹ in order to implement a collaborative care management approach that provides comprehensive training in the integration of behavioral health into the primary care practice.
Proposed Weighting:	Medium
Rationale:	Collaborative care management approaches to integrating behavioral health into primary care practice have been associated with significant improvements in mental health symptom acuity and adherence to treatment in the short- to mid-term. ^{77 78 79} In addition, this activity meets the inclusion criteria of an activity that is likely to lead to improved beneficiary health outcomes. We proposed the weighting of this activity as medium because participation in a training program consists of online reading, attending webinars, or other one-time or short-term activities, which, though beneficial, do not require substantial time or effort by clinicians.
Comments:	Several commenters provided general support for the new improvement activities. A few commenters supported the inclusion of this improvement activity.
Response:	We appreciate the comments of support for this improvement activity.
Final Action:	After consideration of the public comments received, we are finalizing this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_BMH_10
Subcategory:	Behavioral and Mental Health
Activity Title:	Completion of Collaborative Care Management Training Program
Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must complete a collaborative care management training program, such as the American Psychological Association (APA) Collaborative Care Model training program available as part of the Centers for Medicare & Medicaid Services (CMS) Transforming Clinical Practice Initiative (TCPI), ⁹² available to the public, ⁹³ in

⁹⁰ Centers for Medicare & Medicaid Services (CMS) Transforming Clinical Practice Initiative (TCPI) information at <https://innovation.cms.gov/initiatives/Transforming-Clinical-Practices/>.

⁹¹ American Psychological Association (APA) Collaborative Care Model training program information at <https://www.psychiatry.org/psychiatrists/practice/professional-interests/integrated-care/get-trained>.

⁹² Centers for Medicare & Medicaid Services (CMS) Transforming Clinical Practice Initiative (TCPI) information at <https://innovation.cms.gov/initiatives/Transforming-Clinical-Practices/>.

	order to implement a collaborative care management approach that provides comprehensive training in the integration of behavioral health into the primary care practice.
Weighting:	Medium
Proposed Improvement Activity	
Proposed Activity ID:	IA_CC_18
Proposed Subcategory:	Care Coordination
Proposed Activity Title:	Relationship-Centered Communication
Proposed Activity Description:	<p>In order to receive credit for this activity, MIPS eligible clinicians must participate in a minimum of eight hours of training on relationship-centered care⁹⁴ tenets such as making effective open-ended inquiries; eliciting patient stories and perspectives; listening and responding with empathy; using the ART (ask, respond, tell) communication technique to engage patients, and developing a shared care plan.</p> <p>The training may be conducted in formats such as, but not limited to: interactive simulations practicing the skills above, or didactic instructions on how to implement improvement action plans, monitor progress, and promote stability around improved clinician communication.</p>
Proposed Weighting:	Medium
Rationale:	There is currently not an activity in the Inventory that addresses communication between patients and clinicians; this proposed activity would help fill a gap. We believe that this proposed activity meets the inclusion criteria of an activity that is likely to lead to improved beneficiary health outcomes based on research citing the importance of relationship-centered care to patient safety. ⁸¹ We proposed the weighting of this activity as medium because participation in an eight hour training on relationship-centered care, though beneficial, does not require substantial time or effort by clinicians.
Comments:	A few commenters supported the inclusion of this improvement activity. One commenter recommended this activity be weighted high due to the potential for the training to be burdensome to clinicians.
Response:	As stated in section III.I.3.h.(4)(d)(i)(C) of this final rule, the weighting of “medium” is in accordance with our policy, as high weighting should be used for activities that directly address areas with the greatest impact on beneficiary care, safety, health, and well-being and/or is of high intensity, requiring significant investment of time and resources. We do not believe relationship-centered trainings that can be completed in a minimum of eight hours is a significant investment of time and resources and therefore does not warrant a high weighting.
Final Action:	After consideration of the public comments received, we are finalizing this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_CC_18
Subcategory:	Care Coordination
Activity Title:	Relationship-Centered Communication
Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must participate in a minimum of eight hours of training on relationship-centered care ⁹⁵ tenets such as making effective open-ended inquiries; eliciting patient stories and perspectives; listening and responding with empathy; using the ART

	(ask, respond, tell) communication technique to engage patients, and developing a shared care plan. The training may be conducted in formats such as, but not limited to: interactive simulations practicing the skills above, or didactic instructions on how to implement improvement action plans; monitor progress; and promote stability around improved clinician communication.
Weighting:	Medium
Proposed Improvement Activity	
Proposed Activity ID:	IA_PSPA_31
Proposed Subcategory:	Patient Safety and Practice Assessment
Proposed Activity Title:	Patient Medication Risk Education
Proposed Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must provide both written and verbal education regarding the risks of concurrent opioid and benzodiazepine use for patients who are prescribed both benzodiazepines and opioids. Education must be completed for at least 75 percent of qualifying patients and occur: (1) at the time of initial co-prescribing and again following greater than 6 months of co-prescribing of benzodiazepines and opioids, or (2) at least once per MIPS performance period for patients taking concurrent opioid and benzodiazepine therapy.
Proposed Weighting:	High
Rationale:	This activity addresses the Meaningful Measures priority area of Prevention and Treatment of Opioid and Substance Use Disorders ⁹⁶ and addresses the role of clinicians in management of concurrent prescriptions, a topic that is not currently represented in the Inventory. We believe this activity meets the inclusion criteria of an activity that is likely to lead to improved beneficiary health outcomes due to the prevalence of opioid and substance abuse disorders and the medical consequences of mismanagement of concurrent benzodiazepine and opioid prescription. ⁹⁷ We proposed the weighting of this activity as high because it addresses a public health emergency ⁹⁸ and may reduce preventable health conditions related to opioid abuse. High weighting should be used for activities that directly address areas with the greatest impact on beneficiary care, safety, health, and well-being, as explained in the CY 2017 Quality Payment Program final rule (81 FR 77194). We also refer readers to our clarifications regarding weighting at section III.I.3.h.(4) of this final rule. According to the CDC, about 63,000 people died in 2016 of a drug overdose, and well over half of them are attributed to opioids. ⁹⁹ Additionally, according to the 2016 National Survey on Drug Use and Health (NSDUH), 11.8 million individuals ages 12 and older misused any opioid (that is, prescription and/or illicit opioids) and 11.5 million individuals misused prescription opioids. Of those who misused opioids, 2.1 million individuals meet the criteria for an opioid use disorder. ¹⁰⁰ Since

¹⁰⁰ Park-Lee, E., Lipari, R. N., Hedden, S. L., Kroutil, L. A., & Porter, J. D. (2017). Receipt of Services for Substance Use and Mental Health Issues among Adults: Results from the 2016 National Survey on Drug Use and

	providing education regarding the risks of concurrent opioid and benzodiazepine use directly addresses the opioid epidemic, we believe this improvement activity meets our considerations for high-weighting.
Comments:	Several commenters supported the inclusion of this improvement activity. A couple commenters supported the improvement activity's high weighting due to it being part of addressing the increase in opioid drug use, abuse, and overdose deaths. Other commenters provided general support for new improvement activities that address the opioid crisis. Two commenters stated that there is a lack of evidence on when the risks of concurrent opioid and benzodiazepine prescribing outweigh the benefits and likewise when the benefits outweigh the risks.
Response:	We appreciate the comments of support for this improvement activity. We also appreciate the commenters who stated there is a lack of evidence on when the risks of concurrent opioid and benzodiazepine prescribing outweigh the benefits. However, this improvement activity does not require MIPS eligible clinicians to alter their prescribing protocol, except to provide written and verbal education regarding the known risks.
Rationale:	After consideration of the public comments received, we are finalizing this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_PSPA_31
Subcategory:	Patient Safety and Practice Assessment
Activity Title:	Patient Medication Risk Education
Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must provide both written and verbal education regarding the risks of concurrent opioid and benzodiazepine use for patients who are prescribed both benzodiazepines and opioids. Education must be completed for at least 75 percent of qualifying patients and occur: (1) at the time of initial co-prescribing and again following greater than 6 months of co-prescribing of benzodiazepines and opioids, or (2) at least once per MIPS performance period for patients taking concurrent opioid and benzodiazepine therapy.
Weighting:	High
Proposed Improvement Activity	
Proposed Activity ID:	IA_PSPA_32
Proposed Subcategory:	Patient Safety and Practice Assessment
Proposed Activity Title:	Use of CDC Guideline for Clinical Decision Support to Prescribe Opioids for Chronic Pain via Clinical Decision Support
Proposed Activity Description:	In order to receive credit for this activity, MIPS eligible clinicians must utilize the Centers for Disease Control (CDC) Guideline for Prescribing Opioids for Chronic Pain ¹⁰¹ via clinical decision support (CDS). For CDS to be most effective, it needs to be built directly into the clinician workflow and support decision making on a specific patient at the point of care. Specific examples of how the guideline could be incorporated into a CDS workflow include, but are not limited to: electronic health record (EHR)-based prescribing prompts, order sets that require review of guidelines before prescriptions can be entered, and prompts requiring review of guidelines before a subsequent action can be taken in the record.
Proposed Weighting:	High
Rationale:	This activity addresses the Meaningful Measures priority areas of Prevention

	and Treatment of Opioid and Substance Use Disorders and Transfer of Health Information and Interoperability ¹⁰² . Electronic tools like CDS can assist clinicians in preventing adverse patient outcomes. We believe this activity meets the inclusion criteria of an activity that is likely to lead to improved beneficiary health outcomes due to the prevalence of opioid and substance abuse disorders and evidence of CDS supporting improved outcomes and patient safety. ¹⁰³ We proposed the weighting of this activity as high because it promotes interoperability and addresses a public health emergency and may reduce preventable health conditions related to opioid abuse. High weighting should be used for activities that directly address areas with the greatest impact on beneficiary care, safety, health, and well-being, as explained in the CY 2017 Quality Payment Program final rule (81 FR 77194). We also refer readers to our clarifications regarding weighting at section III.I.3.h.(4) of this final rule. According to the CDC, about 63,000 people died in 2016 of a drug overdose, and well over half of them are attributed to opioids. ¹⁰⁴ Additionally, according to the 2016 National Survey on Drug Use and Health (NSDUH), 11.8 million individuals ages 12 and older misused any opioid (that is, prescription and/or illicit opioid) and 11.5 million individuals misused prescription opioids. Of those who misused opioids, 2.1 million individuals meet the criteria for an opioid use disorder. ¹⁰⁵ Since providing education regarding the risks of concurrent opioid and benzodiazepine use directly helps to address the opioid epidemic, and use of CDS addresses CMS's policy focus on Promoting Interoperability, ¹⁰⁶ we believe this improvement activity meets our considerations for high-weighting.
Comments:	Several commenters supported the inclusion of this improvement activity. A couple commenters provided general support for new improvement activities that address the opioid crisis. Two commenters noted that the CDC Guideline for Prescribing Opioids for Chronic Pain are "for primary care physicians prescribing opioids for chronic pain outside of active cancer treatment, palliative care, and end-of-life care," and that including this improvement activity may exacerbate a tendency for specialists to use the Guideline for patient populations for which it is not intended.
Response:	Clinicians may meet this improvement activity by appropriately adhering to the CDC Guideline for Prescribing Opioids for Chronic Care and should pick activities applicable to their clinical practice and patient population.
Final Action:	After consideration of the public comments received, we are finalizing this improvement activity as proposed.
Finalized Improvement Activity

TABLE B: Changes to Previously Adopted Improvement Activities for the MIPS CY 2019 Performance Period and Future Years

Current Improvement Activity	
Current Activity ID:	IA_CC_10
Current Subcategory:	Care Coordination
Current Activity Title:	Care transition documentation practice improvements
Current Activity Description:	Implementation of practices/processes for care transition that include documentation of how a MIPS eligible clinician or group carried out a patient-centered action plan for first 30 days following a discharge (for example, staff involved, phone calls conducted in support of transition, accompaniments, navigation actions, home visits, patient information access).
Current Weighting:	Medium
Proposed Changes and Rationale:	Addition of "...real time communication between PCP and consulting clinicians; PCP included on specialist follow-up or transition communications" as additional examples of how a patient-centered action plan could be documented. Primary care physicians are considered the gatekeeper of patient care. Including them in communications from specialists to patients about their follow-up of transition-of-care promotes continuity between clinicians. Adding this example to this improvement activity underscores the important role specialists play in care transition documentation practice improvement. Other language was revised for clarity.
Proposed Revised Activity Description:	In order to receive credit for this activity, a MIPS eligible clinician must document practices/processes for care transition with documentation of how a MIPS eligible clinician or group carried out an action plan for the patient with the patient's preferences in mind (that is, a "patient-centered" plan) during the first 30 days following a discharge. Examples of these practices/processes for care transition include: staff involved in the care transition; phone calls conducted in support of transition; accompaniments of patients to appointments or other navigation actions; home visits; patient information access to their medical records; real time communication between PCP and consulting clinicians; PCP included on specialist follow-up or transition communications.
Comments:	One commenter supported the proposed modification to this improvement activity. One commenter stated that the addition of specialty-specific examples in the modified improvement activities will provide clarity for specialty clinicians. One commenter provided general concern that modifying an activity while it is still new makes it difficult for clinicians to become familiar with and implement activities. Another commenter requested we modify the activity description to explicitly state that this improvement activity applies to care transitions from acute care and rehabilitation facilities following a fracture, and includes follow-up care related to promoting mobility, reducing falls, and other related activities.
Response:	The proposed modifications to this activity provide examples for further clarification of the role specialists play in care transition documentation practice improvement. Therefore, we do not believe this modification makes it more difficult for clinicians to become familiar with and implement the activity. Additionally, we disagree that we should modify the activity description to explicitly state that this improvement activity applies to certain care transitions, for example those from acute care and rehabilitation facilities, because, we would like to keep the activity description broad. We believe specifying certain care settings without including all others may lead some clinicians to believe they are not eligible to attest to this improvement activity. We will add fracture-related care to subregulatory guidance available on the Quality Payment Program website ¹⁰⁸ so clinicians attesting to this activity are aware this is an allowable service to meet this improvement activity.
Final Action:	After consideration of the public comments received, we are finalizing our changes to

¹⁰⁸ Improvement Activities Data Validation Criteria at <https://www.cms.gov/Medicare/Quality-Payment-Program/Resource-Library/2018-Resources.html>.

	this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_CC_10
Subcategory:	Care Coordination
Activity Title:	Care transition documentation practice improvements
Activity Description:	In order to receive credit for this activity, a MIPS eligible clinician must document practices/processes for care transition with documentation of how a MIPS eligible clinician or group carried out an action plan for the patient with the patient's preferences in mind (that is, a "patient-centered" plan) during the first 30 days following a discharge. Examples of these practices/processes for care transition include: staff involved in the care transition; phone calls conducted in support of transition; accompaniments of patients to appointments or other navigation actions; home visits; patient information access to their medical records; real time communication between PCP and consulting clinicians; PCP included on specialist follow-up or transition communications.
Weighting:	Medium
Current Improvement Activity	
Current Activity ID:	IA_PM_9
Current Subcategory:	Population Management
Current Activity Title:	Participation in Population Health Research
Current Activity Description:	Participation in research that identifies interventions, tools or processes that can improve a targeted patient population.
Current Weighting:	Medium
Proposed Change and Rationale:	We proposed to remove PM_9, because we believe IA_PM_9 and IA_PM_17 are duplicative and provide improvement activity credit for the same activity. In the CY 2017 Quality Payment Program final rule (81 FR 77820), we finalized IA_PM_9: Participation in Population Health Research (activity title); Participation in research that identifies interventions, tools or processes that can improve a targeted patient population (activity description). In the CY 2018 Quality Payment Program final rule (82 FR 54481), we finalized IA_PM_17: Participation in Population Health Research (activity title); participation in federally and/or privately funded research that identifies interventions tools, or processes that can improve a targeted patient population (activity description). We believe IA_PM_9 and IA_PM_17 are duplicative because they include the same subcategory and activity title, and nearly an identical description of the activity; participation in "research that identifies interventions, tools, or processes that can improve a targeted patient population." The two activities are only distinguished by the inclusion in the description for IA_PM_17 specifying that clinicians can meet this activity through participation in federally and/or privately funded research that IA_PM_9 does not. Therefore, we proposed to remove IA_PM_9 and preserve IA_PM_17 so that we will have a consolidated activity that encompasses both improvement activities.
Comments:	Several commenters supported the removal of this improvement activity, due to it being duplicative to IA_PM_17 with the only difference being IA_PM_17 stating that this activity can be met through participation in federally and/or privately funded research. One commenter expressed concern that removing an improvement activity while it is still new makes it difficult for clinicians to become familiar with and implement improvement activities. An additional commenter recommended that if an improvement activity is removed from the Inventory it should be replaced by another improvement activity applicable to clinicians who could attest to the removed one.
Response:	We believe that while consistency in available improvement activities is important, it is confusing to have nearly identical activities that clinicians can attest to. Since these improvement activities are duplicative, a clinician may report IA_PM_17 in the place of IA_PM_9. We do not believe this change will make it more difficult for clinicians to become familiar with or implement improvement activities. Additionally, we do not believe it is necessary to add a new improvement activity to replace one that is being

	removed. We refer readers to section III.I.3.h.(d)(i) of this final rule where we discuss our Criteria for nominating new improvement activities. We also clarified that we use the criteria for nominating new improvement activities in selecting improvement activities for inclusion in the program. Stakeholders can propose new activities through our Annual Call for Activities.
Final Action:	After consideration of the public comments received, we are finalizing the removal of this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	N/A – Removed
Current Improvement Activity	
Current Activity ID:	IA_PM_13
Current Subcategory:	Population Management
Current Activity Title:	Chronic Care and Preventative Care Management for Empaneled Patients
Current Activity Description:	<p>Proactively manage chronic and preventive care for empaneled patients that could include one or more of the following:</p> <ul style="list-style-type: none"> • Provide patients annually with an opportunity for development and/or adjustment of an individualized plan of care as appropriate to age and health status, including health risk appraisal; gender, age and condition-specific preventive care services; and plan of care for chronic conditions; • Use condition-specific pathways for care of chronic conditions (for example, hypertension, diabetes, depression, asthma and heart failure) with evidence-based protocols to guide treatment to target; such as a CDC-recognized diabetes prevention program; • Use pre-visit planning to optimize preventive care and team management of patients with chronic conditions; • Use panel support tools (registry functionality) to identify services due; • Use predictive analytical models to predict risk, onset and progression of chronic diseases; or • Use reminders and outreach (for example, phone calls, emails, postcards, patient portals and community health workers where available) to alert and educate patients about services due; and/or routine medication reconciliation.
Current Weighting:	Medium
Proposed Change and Rationale:	<p>Addition of examples of evidence based, condition-specific pathways for care of chronic conditions: “These might include, but are not limited to, the NCQA Diabetes Recognition Program (DRP) and the NCQA Heart/Stroke Recognition Program (HSRP).” These examples relating to diabetes, heart, and stroke pathways are examples of evidence based, condition-specific pathways for care of chronic conditions. These additions to this activity provide specialist-specific examples of actions that can be taken to meet the intent of this activity. We have received stakeholder feedback that additional specialty-specific activities would be welcome in the improvement activities inventory. Other language was revised for clarity.</p>
Proposed Revised	<p>Chronic Care and Preventative Care Management for Empaneled Patients</p> <p>In order to receive credit for this activity, a MIPS eligible clinician must manage chronic and preventive care for empaneled patients (that is, patients assigned to care teams for the purpose of population health management), which could include one or more of the following actions:</p> <ul style="list-style-type: none"> • Provide patients annually with an opportunity for development and/or adjustment of an individualized plan of care as appropriate to age and health status, including health risk appraisal; gender, age and condition-specific preventive care services; and plan of care for chronic conditions; • Use evidence based, condition-specific pathways for care of chronic conditions (for

	<p>example, hypertension, diabetes, depression, asthma, and heart failure). These might include, but are not limited to, the NCQA Diabetes Recognition Program (DRP)¹⁰⁹ and the NCQA Heart/Stroke Recognition Program (HSRP).¹¹⁰</p> <ul style="list-style-type: none"> • Use pre-visit planning, that is, preparations for conversations or actions to propose with patient before an in-office visit to optimize preventive care and team management of patients with chronic conditions; • Use panel support tools, (that is, registry functionality) or other technology that can use clinical data to identify trends or data points in patient records to identify services due; • Use predictive analytical models to predict risk, onset and progression of chronic diseases; and/or • Use reminders and outreach (for example, phone calls, emails, postcards, patient portals, and community health workers where available) to alert and educate patients about services due; and/or routine medication reconciliation.
Comments:	<p>Several commenters supported the proposed modifications to this improvement activity. One commenter stated that the addition of specialty-specific examples in the modified improvement activities will provide clarity for specialty clinicians. Another commenter recommended additional diabetes-related services, Diabetes Self Management Education and Support (DSME/S) services and Medical Nutrition Therapy (MNT), be included in the description as examples of appropriate services to be included in an individualized plan of care for patients with diabetes. One commenter provided general concern that modifying an activity while it is still new makes it difficult for clinicians to become familiar with and implement improvement activities.</p>
Response:	<p>The proposed modifications to this activity provide additional examples specialists may take to meet this activity. Therefore, we do not believe this modification makes it more difficult for clinicians to become familiar with and implement the activity. Additional diabetes-related services may be eligible for this improvement activity if they are part of a clinician's management of chronic and preventive care for empaneled patients. It is important to note that the examples provided in the description of the improvement activity are not all inclusive and do not preclude clinicians from providing other services to meet this improvement activity. We want this activity to be applicable to all MIPS eligible clinicians providing chronic care and preventative care management to empaneled patients, and since we cannot include all possible activities that could meet this improvement activity and one diabetes-related example is already included, we do not believe adding additional diabetes-related examples to the activity description assists in making the improvement activity applicable to a wide array of clinicians. Upon review of the evidence for DSME/S services and MNT, those examples will be added to the subregulatory guidance available on the Quality Payment Program website¹¹¹ for the improvement activity.</p>
Final Action:	<p>After consideration of the public comments received, we are finalizing our changes to this improvement activity as proposed.</p>
Finalized Improvement Activity

Current Improvement Activity	
Current Activity ID:	IA_PSPA_2
Current Subcategory:	Patient Safety and Practice Assessment
Current Activity Title:	Participation in MOC Part IV
Current Activity Description:	Participation in Maintenance of Certification (MOC) Part IV, such as the American Board of Internal Medicine (ABIM) Approved Quality Improvement (AQI) Program, National Cardiovascular Data Registry (NCDR) Clinical Quality Coach, Quality Practice Initiative Certification Program, American Board of Medical Specialties Practice Performance Improvement Module or American Society of Anesthesiologists (ASA) Simulation Education Network, for improving professional practice including participation in a local, regional or national outcomes registry or quality assessment program. Performance of monthly activities across practice to regularly assess performance in practice, by reviewing outcomes addressing identified areas for improvement and evaluating the results.
Current Weighting:	Medium
Proposed Change and Rationale:	Added two examples of ways in which a MIPS eligible clinician can participate in Maintenance of Certification (MOC) Part IV: participation in “specialty-specific activities including Safety Certification in Outpatient Practice Excellence (SCOPE);” ¹¹⁴ and “American Psychiatric Association (APA) Performance in Practice modules.” ¹¹⁵ These additions to the activity provide specialist-specific examples of actions that can be taken to meet this activity. We have received stakeholder feedback through listening sessions and meetings with various stakeholder entities that additional specialty-specific activities would be welcome in the Inventory. Specifically, adding these examples of activities in psychiatry and obstetrics and gynecology, respectively, fill a gap in the

	Inventory. Other language was revised for clarity.
Proposed Revised Activity Description:	<p>In order to receive credit for this activity, a MIPS eligible clinician must participate in Maintenance of Certification (MOC) Part IV.¹¹⁶ MOC Part IV requires clinicians to perform monthly activities across practice to regularly assess performance by reviewing outcomes addressing identified areas for improvement and evaluating the results.</p> <p>Some examples of activities that can be completed to receive MOC Part IV credit are: the American Board of Internal Medicine (ABIM) Approved Quality Improvement (AQI) Program,¹¹⁷ National Cardiovascular Data Registry (NCDR) Clinical Quality Coach,¹¹⁸ Quality Practice Initiative Certification Program,¹¹⁹ American Board of Medical Specialties Practice Performance Improvement Module¹²⁰ or American Society of Anesthesiologists (ASA) Simulation Education Network,¹²¹ for improving professional practice including participation in a local, regional or national outcomes registry or quality assessment program; specialty-specific activities including Safety Certification in Outpatient Practice Excellence (SCOPE);¹²² American Psychiatric Association (APA) Performance in Practice modules.¹²³</p>
Comments:	<p>One commenter supported the proposed modifications to this improvement activity. Another commenter stated that the addition of specialty-specific examples in the modified improvement activities will provide clarity for specialty clinicians. A few commenters supported the addition of the specialist examples for this improvement activity, and one commenter provided general concern that modifying an activity while it is still new makes it difficult for clinicians to become familiar with and implement improvement activities. An additional commenter requested the inclusion of a reference to specific practice activities related to comprehensive pediatric eye and vision examination clinical practice guidelines to meet this improvement activity.</p>
Response:	<p>The proposed modifications to this improvement activity provide additional examples of activities that can be completed to receive MOC Part IV credit. Therefore, we do not believe this modification makes it more difficult for clinicians to become familiar with and implement the activity. We appreciate the recommendation to include an additional example related to eye examinations, but we have included several examples and do not believe an additional example is needed in the activity description to describe the various ways clinicians can meet this improvement activity. We will add the American Board of Optometry's Performance in Practice activities, within which the comprehensive pediatric eye and vision examination clinical practice guidelines falls, to the subregulatory guidance available on the Quality Payment Program website¹²⁴ so</p>

¹³² American Psychiatric Association Learning Center resource at <https://education.psychiatry.org/Users/ProductList.aspx?TypeID=8>.

Rationale:	example/category of an action that can be undertaken to meet the requirements of this activity. This addition highlights an evidence-based tool that can be deployed to assess opiate risk and addresses the CMS Meaningful Measures area of Prevention and Treatment of Opioid and Substance Use Disorders. ¹³³ Other language was revised for clarity.
Proposed Revised Activity Description:	In order to receive credit for this activity, a MIPS eligible clinician must use tools that assist specialty practices in tracking specific measures that are meaningful to their practice. Some examples of tools that could satisfy this activity are: a surgical risk calculator; evidence based protocols, such as Enhanced Recovery After Surgery (ERAS) protocols; ¹³⁴ the Centers for Disease Control (CDC) Guide for Infection Prevention for Outpatient Settings predictive algorithms; ¹³⁵ and the opiate risk tool (ORT) ¹³⁶ or similar tool.
Comments:	One commenter stated that the addition of specialty-specific examples in the modified improvement activities will provide clarity for specialty clinicians. A couple of commenters provided support for the addition of the opiate risk tool or other similar tools as a way of addressing the opioid crisis. One commenter provided general concern that modifying an activity while it is still new makes it difficult for clinicians to become familiar with and implement improvement activities.
Response:	The proposed modification to this improvement activity provides an additional tool as an example that can be undertaken to meet the requirements of this improvement activity. Therefore, we do not believe this modification makes it more difficult for clinicians to become familiar with and implement the activity.
Final Action:	After consideration of the public comments received, we are finalizing our changes to this improvement activity as proposed.

Current Subcategory:	Patient Safety and Practice Assessment
Current Activity Title:	Implementation of analytic capabilities to manage total cost of care for practice population

¹³³ Centers for Medicare & Medicaid Services “Meaningful Measures Hub” resource at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/MMF/General-info-Sub-Page.html#MeasureAreasDefined>.

¹³⁴ Enhanced Recovery After Surgery (ERAS) protocols at <http://aserhq.org/protocols/>.

¹³⁵ The Centers for Disease Control (CDC) Guide for Infection Prevention for Outpatient Settings at <https://www.cdc.gov/hai/settings/outpatient/outpatient-care-guidelines.html>.

¹³⁶ The Opiate Risk Tool at <https://www.drugabuse.gov/sites/default/files/files/OpioidRiskTool.pdf>.

¹³⁷ Enhanced Recovery After Surgery (ERAS) protocols at <http://aserhq.org/protocols/>.

¹³⁸ The Centers for Disease Control (CDC) Guide for Infection Prevention for Outpatient Settings at <https://www.cdc.gov/hai/settings/outpatient/outpatient-care-guidelines.html>.

¹³⁹ The Opiate Risk Tool at <https://www.drugabuse.gov/sites/default/files/files/OpioidRiskTool.pdf>.

Current Activity Description:	Build the analytic capability required to manage total cost of care for the practice population that could include one or more of the following: <ul style="list-style-type: none"> • Train appropriate staff on interpretation of cost and utilization information; and/or • Use available data regularly to analyze opportunities to reduce cost through improved care.
Current Weighting:	Medium
Proposed Change and Rationale:	We added an example platform that uses available data to analyze opportunities to reduce cost through improved care: “An example of a platform with the necessary analytic capability is the American Society for Gastrointestinal (GI) Endoscopy’s GI Operations Benchmarking Platform.” ¹⁴⁰ Based on stakeholder feedback, we proposed to add this example to clarify what type of a platform has the analytic capability to improve and manage total cost of care for the practice population described. Other language was revised for clarity.
Proposed Revised Activity Description:	In order to receive credit for this activity, a MIPS eligible clinician must conduct or build the capacity to conduct analytic activities to manage total cost of care for the practice population. Examples of these activities could include: <ul style="list-style-type: none"> • Train appropriate staff on interpretation of cost and utilization information; • Use available data regularly to analyze opportunities to reduce cost through improved care. An example of a platform with the necessary analytic capability to do this is the American Society for Gastrointestinal (GI) Endoscopy’s GI Operations Benchmarking Platform.
Comments:	One commenter supported the modification of this improvement activity. Another commenter stated that the addition of specialty-specific examples in the modified improvement activities will provide clarity for specialty clinicians. One commenter provided general concern that modifying an improvement activity while it is still new makes it difficult for clinicians to become familiar with and implement improvement activities. One commenter suggested including Fracture Liaison Service (FLS) programs as an example of a model to manage fracture recovery and risk.
Response:	We appreciate the commenters’ support and the additional suggested example to provide greater clarification for this improvement activity. The modifications to this activity provide an example to clarify the type of platform that has the analytic capability to improve and manage total cost of care for the practice population described. Therefore, we do not believe this modification makes it more difficult for clinicians to become familiar with and implement the activity. We do not believe the FLS program meets the requirements of this improvement activity, as we do not agree that it provides analytic capability to manage population cost of care.
Final Action:	After consideration of the public comments received, we are finalizing our changes to this improvement activity as proposed.
